# Matrices for Linear Transformations

## Example

Suppose that  $T : \mathbb{R}^2 \rightarrow \mathbb{R}^3$  is a linear transformation which satisfies

$$T(\mathbf{e}_1) = \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} \quad \text{and} \quad T(\mathbf{e}_2) = \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix}$$

where  $\mathbf{e}_1 = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$  and  $\mathbf{e}_2 = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$ . Find a formula for  $T(\mathbf{x})$ .

## Matrices for Linear T

$$T(\mathbf{e}_1) = \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} \quad T(\mathbf{e}_2) = \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix}$$

Because  $T$  is linear and because

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = x_1 \begin{bmatrix} 1 \\ 0 \end{bmatrix} + x_2 \begin{bmatrix} 0 \\ 1 \end{bmatrix} = x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2$$

## Matrices for Linear Transformations

$$T(\mathbf{e}_1) = \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} \quad T(\mathbf{e}_2) = \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix}$$

Because  $T$  is linear and because

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = x_1 \begin{bmatrix} 1 \\ 0 \end{bmatrix} + x_2 \begin{bmatrix} 0 \\ 1 \end{bmatrix} = x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2$$

we have that

$$T(\mathbf{x}) = T(x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2) = x_1 T(\mathbf{e}_1) + x_2 T(\mathbf{e}_2)$$

=

=

=

## Matrices for Linear T

$$T(\mathbf{e}_1) = \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} \quad T(\mathbf{e}_2) = \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix}$$

Because  $T$  is linear and because

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = x_1 \begin{bmatrix} 1 \\ 0 \end{bmatrix} + x_2 \begin{bmatrix} 0 \\ 1 \end{bmatrix} = x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2$$

we have that

$$T(\mathbf{x}) = T(x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2) = x_1 T(\mathbf{e}_1) + x_2 T(\mathbf{e}_2)$$

$$= x_1 \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} + x_2 \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix} = \begin{bmatrix} 5x_1 - 3x_2 \\ -7x_1 + 8x_2 \\ 2x_1 \end{bmatrix}$$

=

=

## Matrices for Linear T

$$T(\mathbf{e}_1) = \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} \quad T(\mathbf{e}_2) = \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix}$$

Because  $T$  is linear and because

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = x_1 \begin{bmatrix} 1 \\ 0 \end{bmatrix} + x_2 \begin{bmatrix} 0 \\ 1 \end{bmatrix} = x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2$$

we have that

$$T(\mathbf{x}) = T(x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2) = x_1 T(\mathbf{e}_1) + x_2 T(\mathbf{e}_2)$$

$$= x_1 \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} + x_2 \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix} = \begin{bmatrix} 5x_1 - 3x_2 \\ -7x_1 + 8x_2 \\ 2x_1 \end{bmatrix}$$

$$= \begin{bmatrix} 5 & -3 \\ -7 & 8 \\ 2 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} =$$

## Matrices for Linear Transformations

$$T(\mathbf{e}_1) = \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} \quad T(\mathbf{e}_2) = \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix}$$

Because  $T$  is linear and because

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = x_1 \begin{bmatrix} 1 \\ 0 \end{bmatrix} + x_2 \begin{bmatrix} 0 \\ 1 \end{bmatrix} = x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2$$

we have that

$$\begin{aligned} T(\mathbf{x}) &= T(x_1 \mathbf{e}_1 + x_2 \mathbf{e}_2) = x_1 T(\mathbf{e}_1) + x_2 T(\mathbf{e}_2) \\ &= x_1 \begin{bmatrix} 5 \\ -7 \\ 2 \end{bmatrix} + x_2 \begin{bmatrix} -3 \\ 8 \\ 0 \end{bmatrix} = \begin{bmatrix} 5x_1 - 3x_2 \\ -7x_1 + 8x_2 \\ 2x_1 \end{bmatrix} \\ &= \begin{bmatrix} 5 & -3 \\ -7 & 8 \\ 2 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} T(\mathbf{e}_1) & T(\mathbf{e}_2) \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = A\mathbf{x}. \end{aligned}$$

# Matrices for Linear Transformations

## Theorem

*Let  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  be a linear transformation. Then there exists a unique matrix  $A$  such that*

$$T(\mathbf{x}) = A\mathbf{x}$$

*for all  $\mathbf{x} \in \mathbb{R}^n$ .*

# Matrices for Linear Transformations

## Theorem

Let  $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$  be a linear transformation. Then there exists a unique matrix  $A$  such that

$$T(\mathbf{x}) = A\mathbf{x}$$

for all  $\mathbf{x} \in \mathbb{R}^n$ .

In fact,  $A$  is the matrix

$$A = \begin{bmatrix} T(\mathbf{e}_1) & T(\mathbf{e}_2) & \cdots & T(\mathbf{e}_n) \end{bmatrix}$$

where  $\mathbf{e}_j$  is the  $j$ th column of the identity matrix  $I_n$ .

# Matrices for Linear Transformations

Proof.

First suppose that  $\mathbf{x} = x_1\mathbf{e}_1 + x_2\mathbf{e}_2 + \dots + x_n\mathbf{e}_n$ . Then

$$\begin{aligned} T(\mathbf{x}) &= T(x_1\mathbf{e}_1 + x_2\mathbf{e}_2 + \dots + x_n\mathbf{e}_n) \\ &= x_1T(\mathbf{e}_1) + x_2T(\mathbf{e}_2) + \dots + x_nT(\mathbf{e}_n) \\ &= \begin{bmatrix} T(\mathbf{e}_1) & T(\mathbf{e}_2) & \cdots & T(\mathbf{e}_n) \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = A\mathbf{x}. \end{aligned}$$

This proves the existence part of the theorem.

# Matrices for Linear Transformations

Proof continued.

Now we need to prove that such a matrix is unique: Suppose that  $T(\mathbf{x}) = A\mathbf{x}$  and  $T(\mathbf{x}) = B\mathbf{x}$ .

# Matrices for Linear Transformations

Proof continued.

Now we need to prove that such a matrix is unique: Suppose that  $T(\mathbf{x}) = A\mathbf{x}$  and  $T(\mathbf{x}) = B\mathbf{x}$ . Then for each  $j$  we have

$$A\mathbf{e}_j = T(\mathbf{e}_j) = B\mathbf{e}_j =$$

# Matrices for Linear Transformations

Proof continued.

Now we need to prove that such a matrix is unique: Suppose that  $T(\mathbf{x}) = A\mathbf{x}$  and  $T(\mathbf{x}) = B\mathbf{x}$ . Then for each  $j$  we have

$$\begin{array}{ccc} \text{the } j\text{th} & & \text{the } j\text{th} \\ \text{column of } & = A\mathbf{e}_j = T(\mathbf{e}_j) = B\mathbf{e}_j = & \text{column of } \\ A & & B \end{array}$$

# Matrices for Linear Transformations

Proof continued.

Now we need to prove that such a matrix is unique: Suppose that  $T(\mathbf{x}) = A\mathbf{x}$  and  $T(\mathbf{x}) = B\mathbf{x}$ . Then for each  $j$  we have

$$\begin{array}{ccc} \text{the } j\text{th} & & \text{the } j\text{th} \\ \text{column of } & = A\mathbf{e}_j = T(\mathbf{e}_j) = B\mathbf{e}_j = & \text{column of } \\ A & & B \end{array}$$

Hence  $A = B$  and we are finished. □

# Matrices for Linear Transformations

Proof continued.

Now we need to prove that such a matrix is unique: Suppose that  $T(\mathbf{x}) = A\mathbf{x}$  and  $T(\mathbf{x}) = B\mathbf{x}$ . Then for each  $j$  we have

$$\begin{array}{ll} \text{the } j\text{th} & \text{the } j\text{th} \\ \text{column of } & = A\mathbf{e}_j = T(\mathbf{e}_j) = B\mathbf{e}_j = \text{column of} \\ A & B \end{array}$$

Hence  $A = B$  and we are finished. □

## Definition

The matrix  $A$  is called the *standard matrix for  $T$*  and is written  $[T]$ .

**EXAMPLE 2** Find the standard matrix  $A$  for the dilation transformation  $T(\mathbf{x}) = 3\mathbf{x}$ , for  $\mathbf{x}$  in  $\mathbb{R}^2$ .

**SOLUTION** Write

$$T(\mathbf{e}_1) = 3\mathbf{e}_1 = \begin{bmatrix} 3 \\ 0 \end{bmatrix} \quad \text{and} \quad T(\mathbf{e}_2) = 3\mathbf{e}_2 = \begin{bmatrix} 0 \\ 3 \end{bmatrix}$$

The diagram illustrates the mapping of the standard basis vectors  $\mathbf{e}_1$  and  $\mathbf{e}_2$  under the dilation transformation  $T$ . Two blue arrows point from the equations above to the columns of the matrix  $A$  below. The first arrow points to the first column of  $A$ , which is  $\begin{bmatrix} 3 \\ 0 \end{bmatrix}$ . The second arrow points to the second column of  $A$ , which is  $\begin{bmatrix} 0 \\ 3 \end{bmatrix}$ .

$$A = \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}$$

■

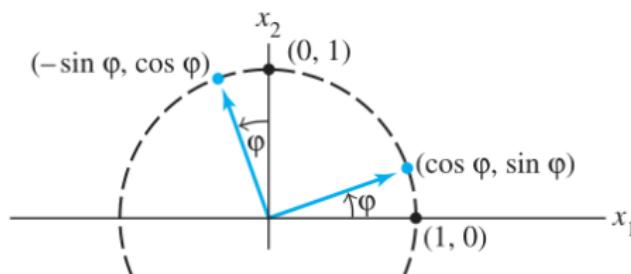

**EXAMPLE 3** Let  $T : \mathbb{R}^2 \rightarrow \mathbb{R}^2$  be the transformation that rotates each point in  $\mathbb{R}^2$  about the origin through an angle  $\varphi$ , with counterclockwise rotation for a positive angle. We could show geometrically that such a transformation is linear. (See Fig. 6 in Section 1.8.) Find the standard matrix  $A$  of this transformation.

**SOLUTION**  $\begin{bmatrix} 1 \\ 0 \end{bmatrix}$  rotates into  $\begin{bmatrix} \cos \varphi \\ \sin \varphi \end{bmatrix}$ , and  $\begin{bmatrix} 0 \\ 1 \end{bmatrix}$  rotates into  $\begin{bmatrix} -\sin \varphi \\ \cos \varphi \end{bmatrix}$ . See Fig. 1.

By Theorem 10,

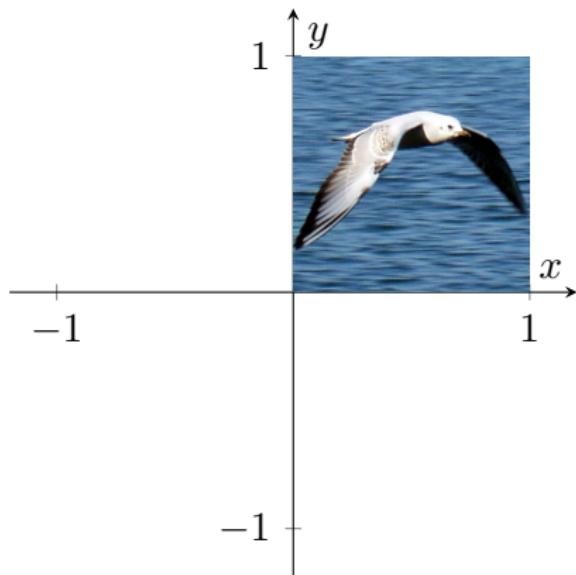

$$A = \begin{bmatrix} \cos \varphi & -\sin \varphi \\ \sin \varphi & \cos \varphi \end{bmatrix}$$

Example 5 in Section 1.8 is a special case of this transformation, with  $\varphi = \pi/2$ . ■

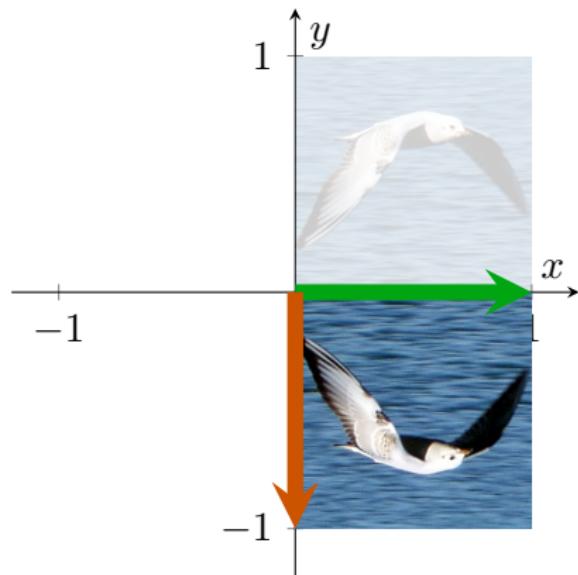

**FIGURE 1** A rotation transformation.

## Reflections

## Reflections

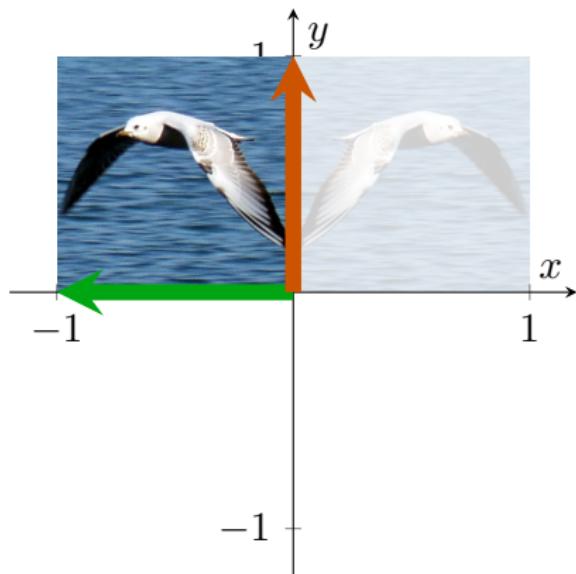

Reflection about the  $x$ -axis

$$T(\mathbf{e}_1) = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ -1 \end{bmatrix}$$

$$[T] = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$$

## Reflections

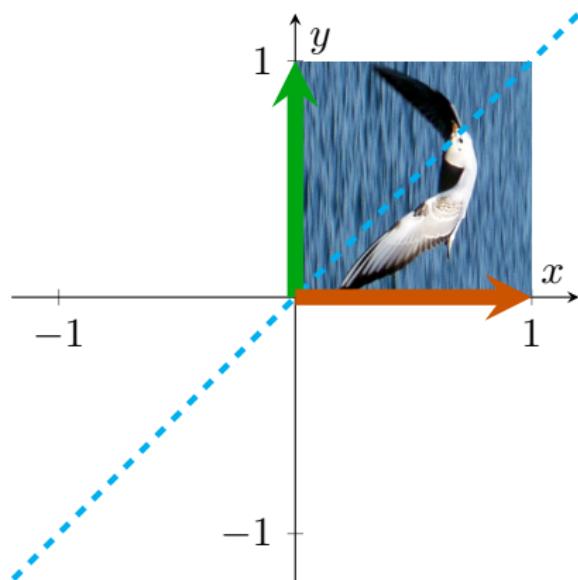

Reflection about the  $y$ -axis

$$T(\mathbf{e}_1) = \begin{bmatrix} -1 \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$[T] = \begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix}$$

## Reflections

Reflection about the line

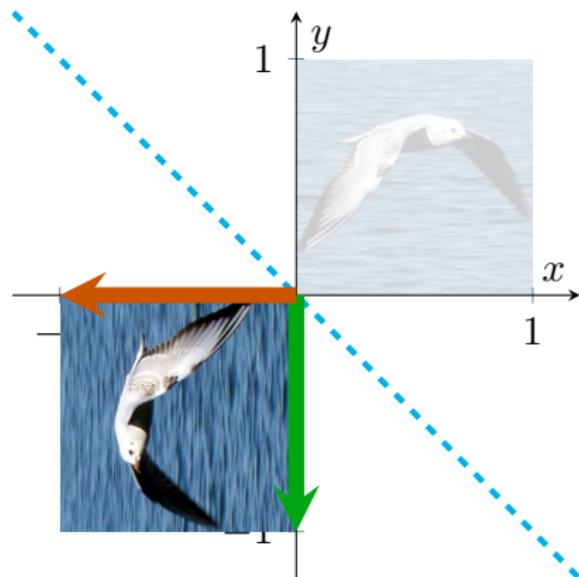

$$y = x$$

$$T(\mathbf{e}_1) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

$$[T] = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

## Reflections

Reflection about the line

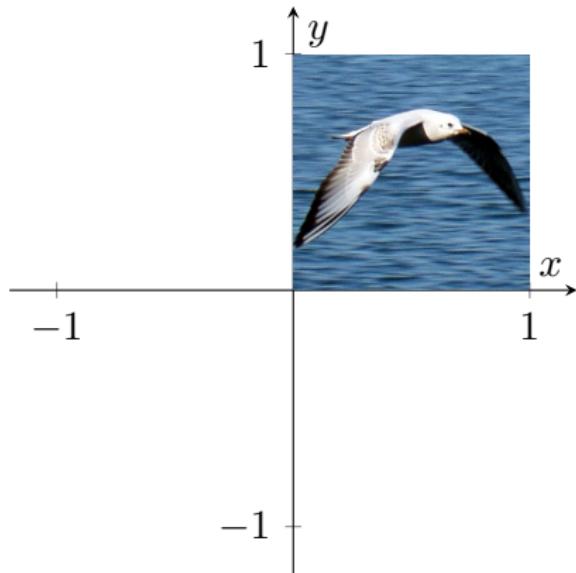

$$y = -x$$

$$T(\mathbf{e}_1) = \begin{bmatrix} 0 \\ -1 \end{bmatrix}$$

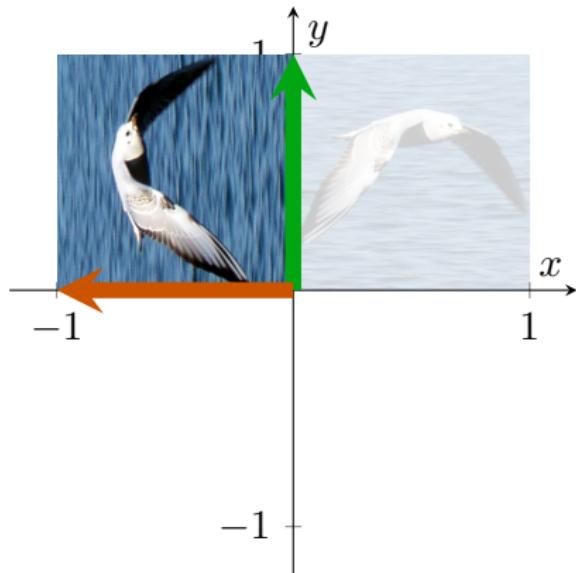

$$T(\mathbf{e}_2) = \begin{bmatrix} -1 \\ 0 \end{bmatrix}$$

$$[T] = \begin{bmatrix} 0 & -1 \\ -1 & 0 \end{bmatrix}$$

## Rotations

## Rotations

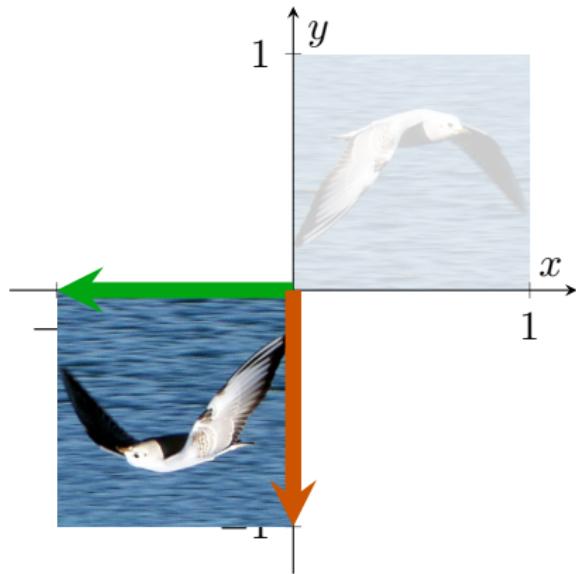

Rotate by  $90^\circ$

$$T(\mathbf{e}_1) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} -1 \\ 0 \end{bmatrix}$$

$$[T] = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$$

## Rotations

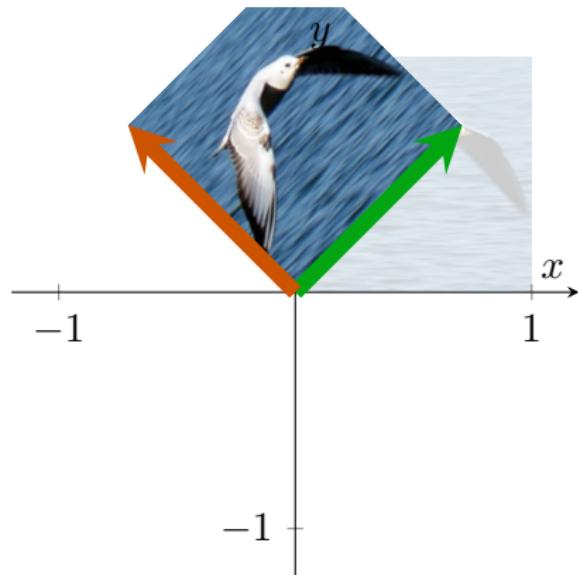

Rotate by 180°

$$T(\mathbf{e}_1) = \begin{bmatrix} -1 \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ -1 \end{bmatrix}$$

$$[T] = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

## Rotations

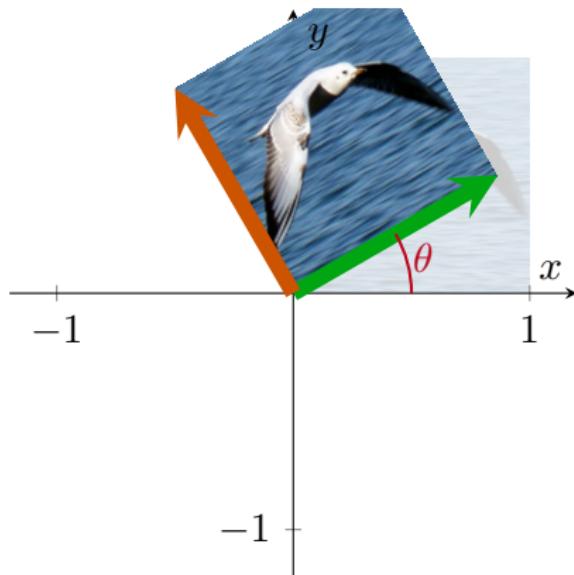

Rotate by  $45^\circ$

$$T(\mathbf{e}_1) = \begin{bmatrix} \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} -\frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} \end{bmatrix}$$

$$[T] = \begin{bmatrix} \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix}$$

## Rotations

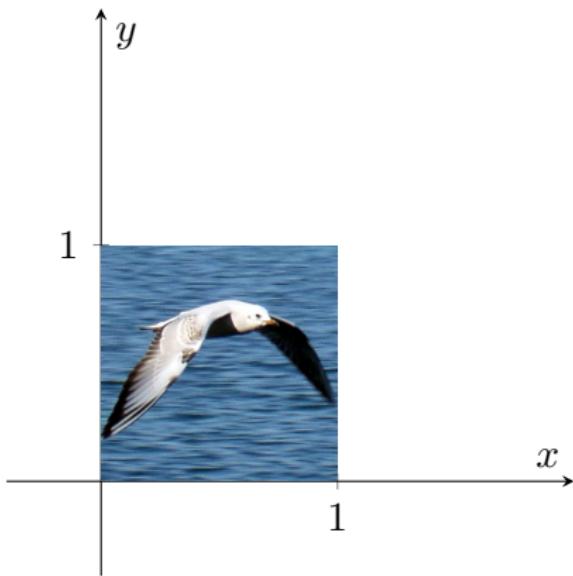

Rotate by  $\theta$

$$T(\mathbf{e}_1) = \begin{bmatrix} \cos \theta \\ \sin \theta \end{bmatrix}$$

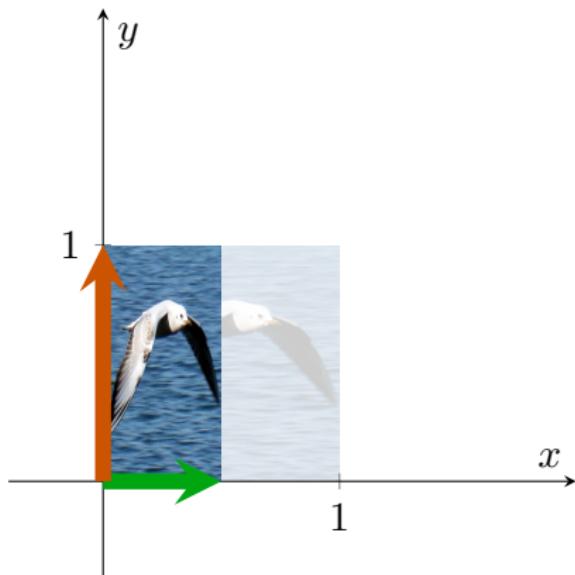

$$T(\mathbf{e}_2) = \begin{bmatrix} -\sin \theta \\ \cos \theta \end{bmatrix}$$

$$[T] = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix}$$

## Contractions and Expansions

## Contractions and Expansions

Horizontal Contraction

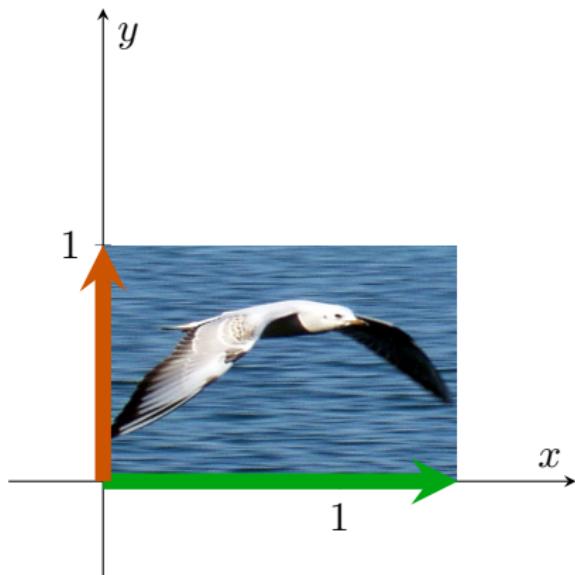

$$T(\mathbf{e}_1) = \begin{bmatrix} k \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$[T] = \begin{bmatrix} k & 0 \\ 0 & 1 \end{bmatrix}$$

$$0 < k < 1$$

## Contractions and Expansions

Horizontal Expansion

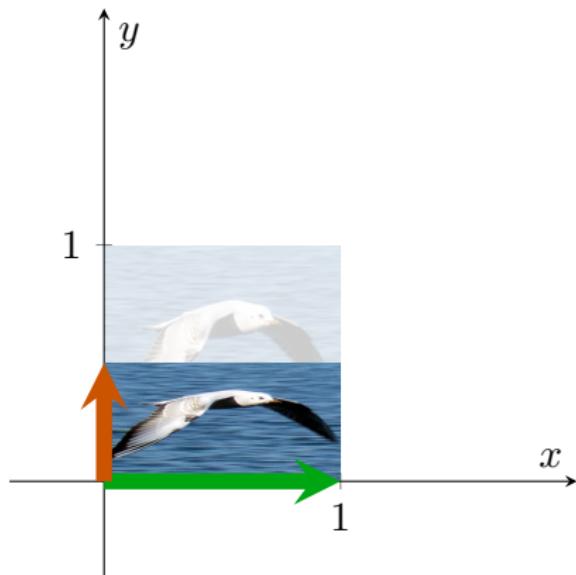

$$T(\mathbf{e}_1) = \begin{bmatrix} k \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$[T] = \begin{bmatrix} k & 0 \\ 0 & 1 \end{bmatrix}$$

$$k > 1$$

## Contractions and Expansions

Vertical Contraction

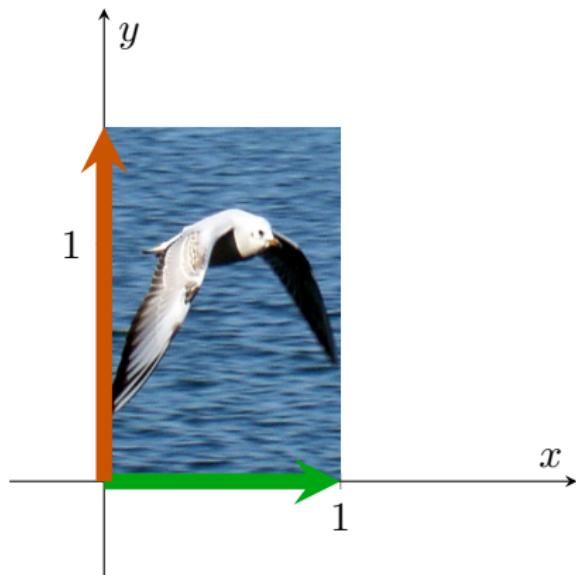

$$T(\mathbf{e}_1) = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ k \end{bmatrix}$$

$$[T] = \begin{bmatrix} 1 & 0 \\ 0 & k \end{bmatrix}$$

$$0 < k < 1$$

## Contractions and Expansions

Vertical Expansion

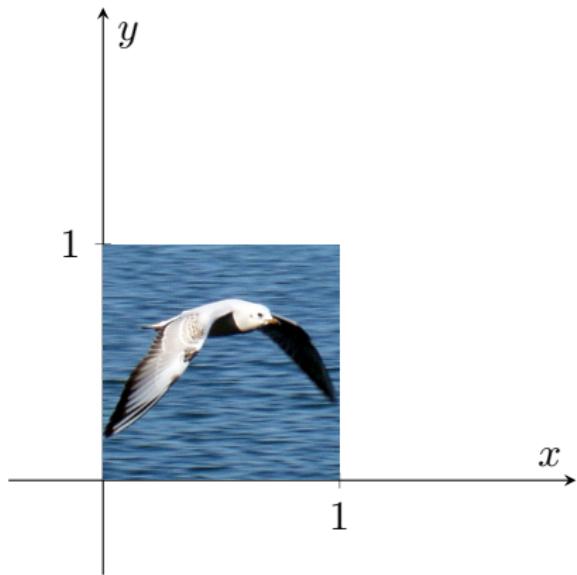

$$T(\mathbf{e}_1) = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ k \end{bmatrix}$$

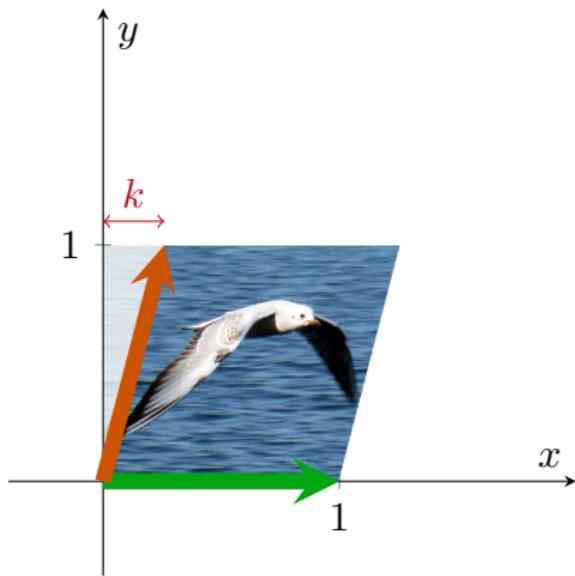

$$[T] = \begin{bmatrix} 1 & 0 \\ 0 & k \end{bmatrix}$$

$$k > 1$$

## Shears

## Shears

Horizontal Shear

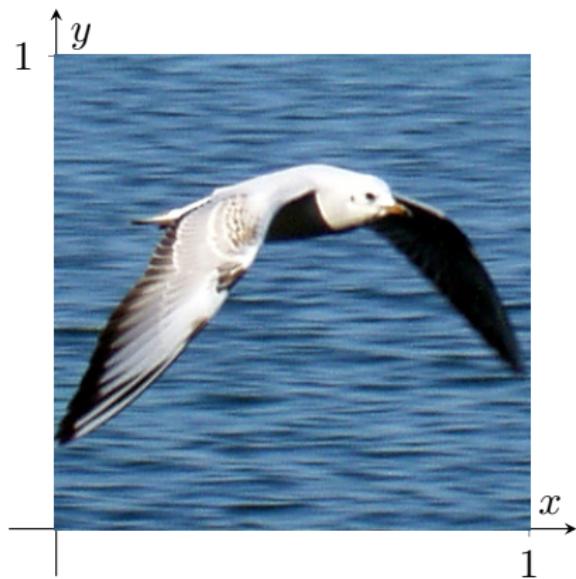

$$T(\mathbf{e}_1) = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} k \\ 1 \end{bmatrix}$$

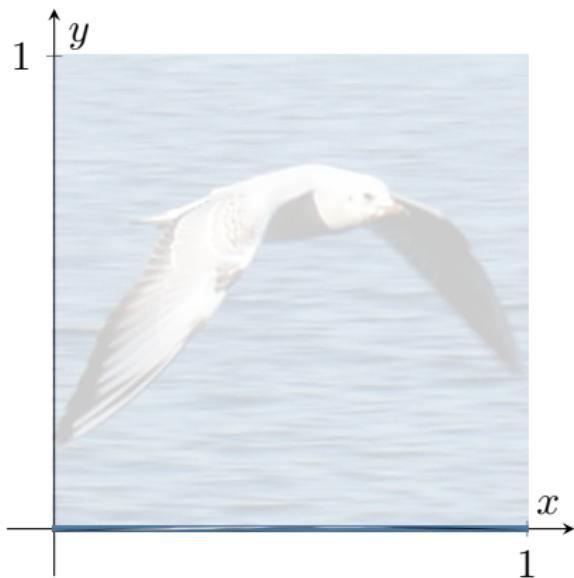

$$[T] = \begin{bmatrix} 1 & k \\ 0 & 1 \end{bmatrix}$$

$$k > 0$$

## Orthogonal Projections

## Orthogonal Projections

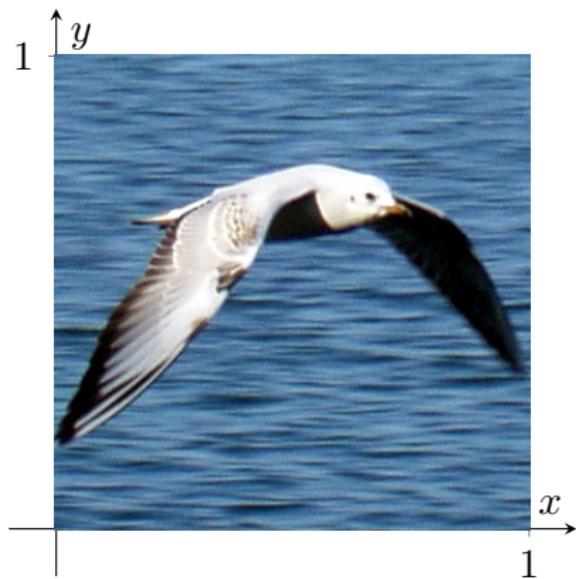

Projection onto the  $x$ -axis

$$T(\mathbf{e}_1) = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

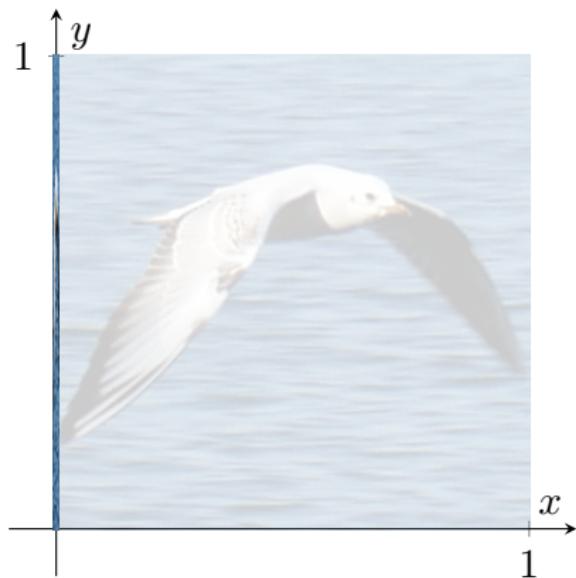

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$[T] = \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}$$

## Orthogonal Projections

## Orthogonal Projections

Projection onto the  $y$ -axis

$$T(\mathbf{e}_1) = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$T(\mathbf{e}_2) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$[T] = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}$$

## A Matrix for $T$ relative to two bases

Let

- $V$  be an  $n$ -dimensional vector space;
- $\mathcal{B}$  be a basis for  $V$ ;
- $W$  be an  $m$ -dimensional vector space;
- $\mathcal{C}$  is a basis for  $W$ ; and
- $T : V \rightarrow W$  be a linear transformation.

# Matrices for Linear Transformations

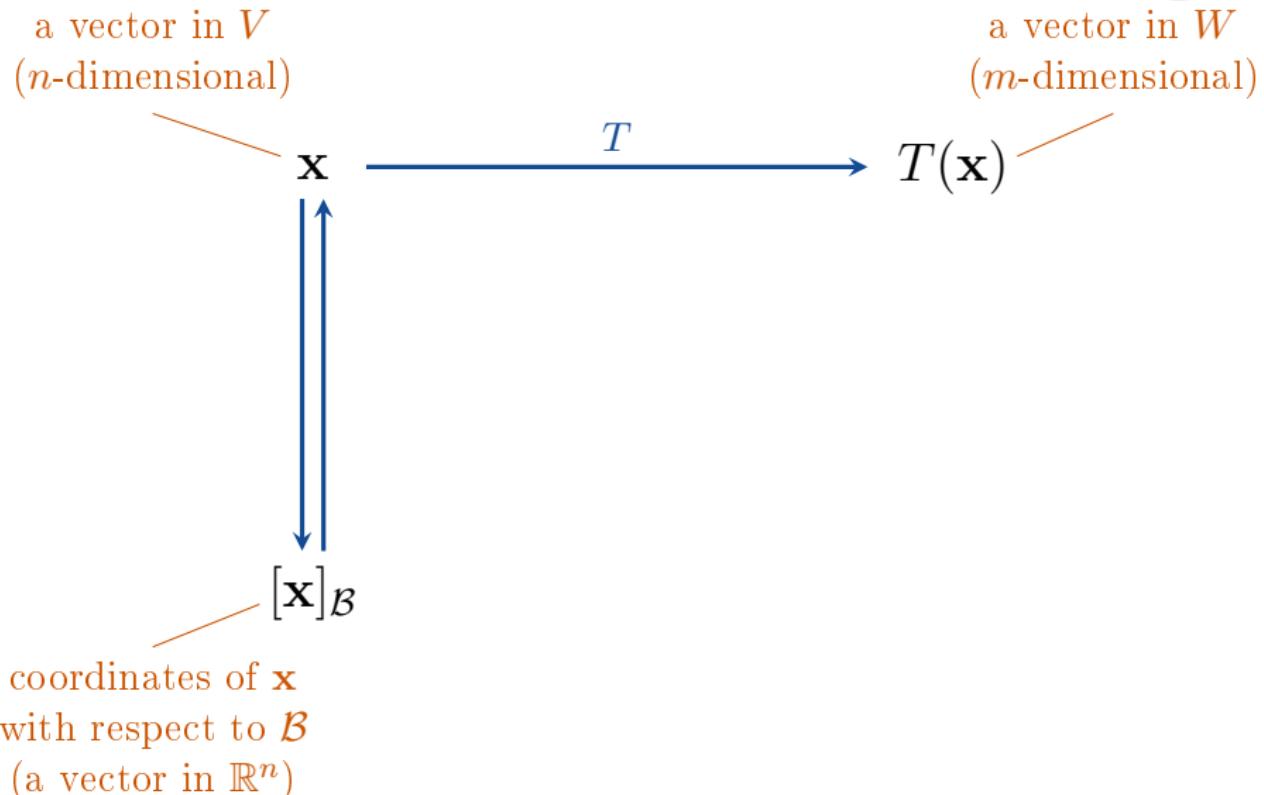

a vector in  $V$   
( $n$ -dimensional)

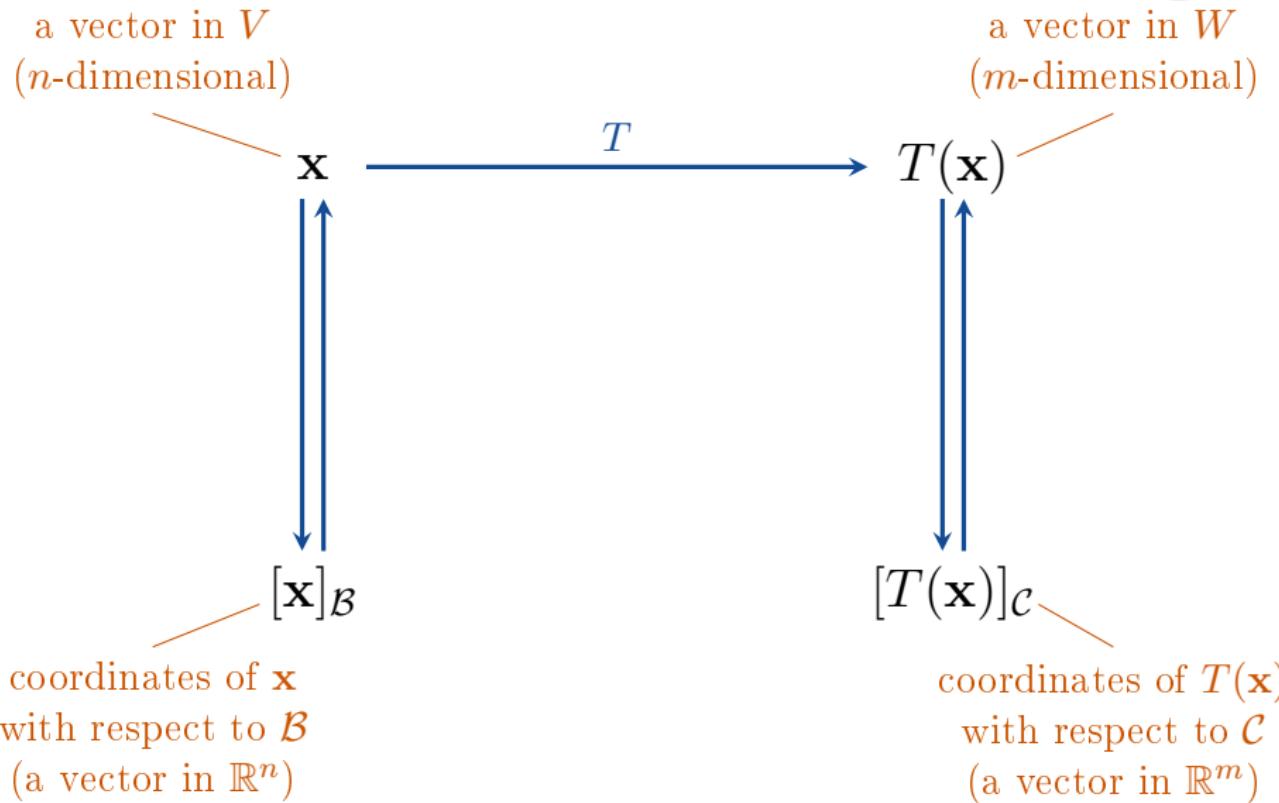

a vector in  $W$   
( $m$ -dimensional)

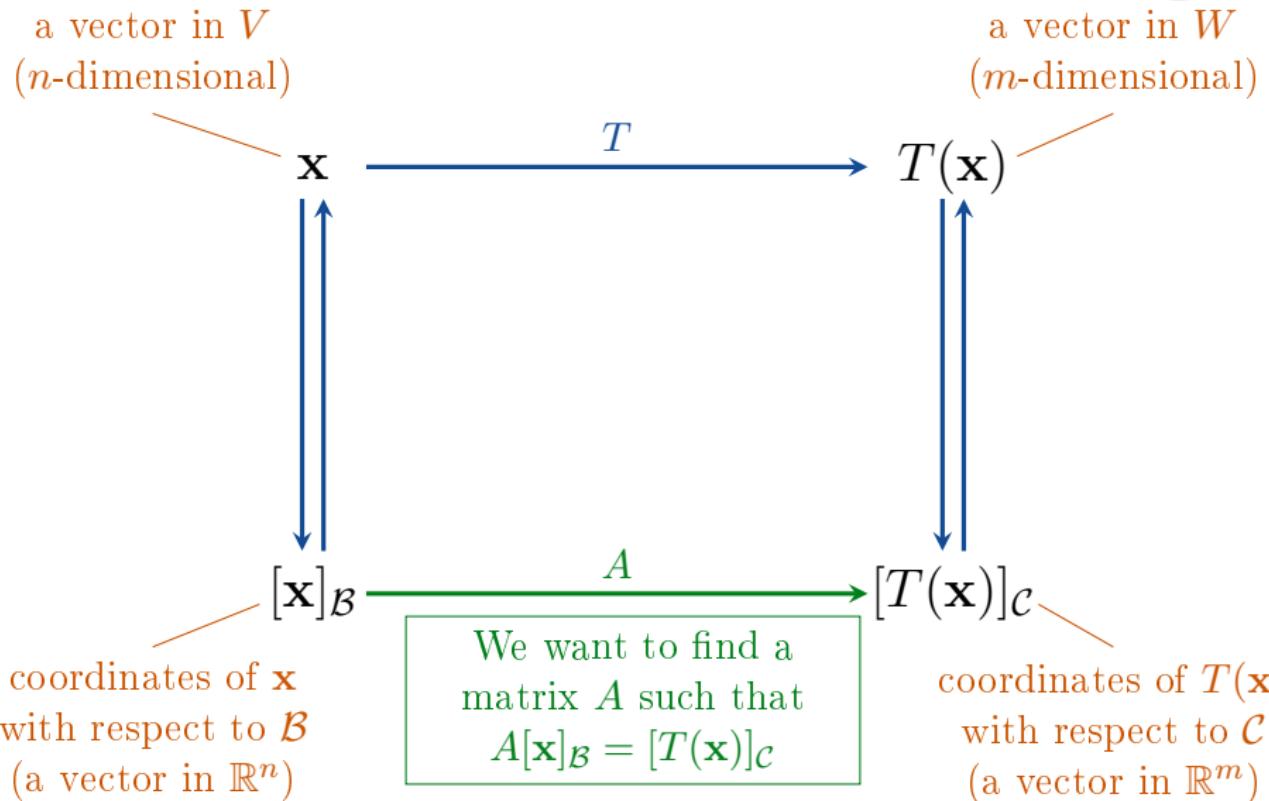

# Matrices for Linear Transformations

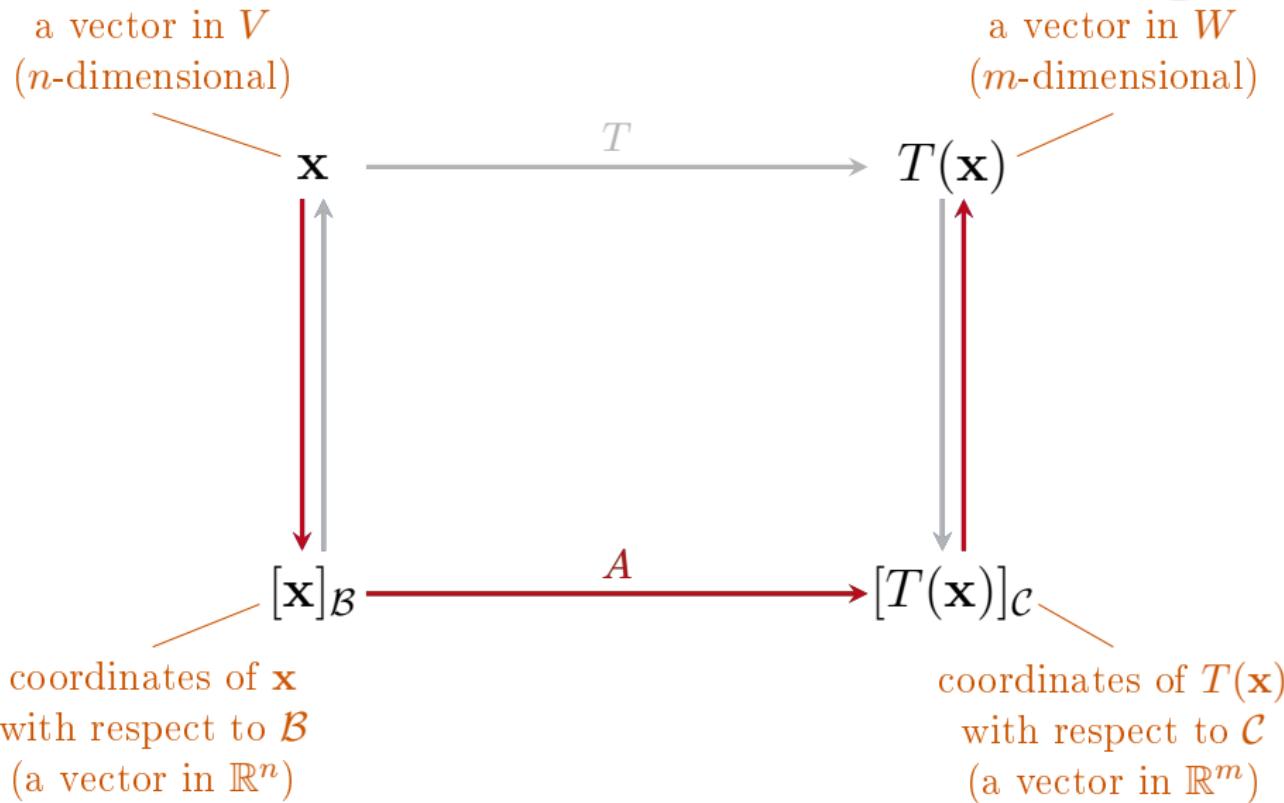

# Matrices for Linear Transformations

# Matrices for Linear Transformations

# Matrices for Linear Transformations

# Matrices for Linear Transformations

$$T : V \rightarrow W$$

We want to find an  $m \times n$  matrix  $A$  such that

$$A[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}.$$

# Matrices for Linear Transformations

$$T : V \rightarrow W$$

We want to find an  $m \times n$  matrix  $A$  such that

$$A[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}.$$

Let

- $\mathcal{B} = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$  be a basis for the  $n$ -dimensional vector space  $V$ ; and
- $\mathcal{C} = \{\mathbf{w}_1, \mathbf{w}_2, \dots, \mathbf{w}_m\}$  be a basis for the  $m$ -dimensional vector space  $W$ .

(This is on page 307 of your textbook.)

$$A[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}$$

We need  $A$  to satisfy

$$A[\mathbf{v}_1]_{\mathcal{B}} = [T(\mathbf{v}_1)]_{\mathcal{C}}, \ A[\mathbf{v}_s]_{\mathcal{B}} = [T(\mathbf{v}_s)]_{\mathcal{C}}, \ \dots, \ A[\mathbf{v}_n]_{\mathcal{B}} = [T(\mathbf{v}_n)]_{\mathcal{C}}.$$

$$A[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}$$

We need  $A$  to satisfy

$$A[\mathbf{v}_1]_{\mathcal{B}} = [T(\mathbf{v}_1)]_{\mathcal{C}}, \quad A[\mathbf{v}_s]_{\mathcal{B}} = [T(\mathbf{v}_s)]_{\mathcal{C}}, \quad \dots, \quad A[\mathbf{v}_n]_{\mathcal{B}} = [T(\mathbf{v}_n)]_{\mathcal{C}}.$$

But  $\mathbf{v}_1 = 1\mathbf{v}_1 + 0\mathbf{v}_2 + 0\mathbf{v}_3 + \dots + 0\mathbf{v}_n$  so

$$[\mathbf{v}_1]_{\mathcal{B}} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ \vdots \\ 0 \end{bmatrix}$$

We need  $A$  to satisfy

$$A[\mathbf{v}_1]_{\mathcal{B}} = [T(\mathbf{v}_1)]_{\mathcal{C}}, \quad A[\mathbf{v}_s]_{\mathcal{B}} = [T(\mathbf{v}_s)]_{\mathcal{C}}, \quad \dots, \quad A[\mathbf{v}_n]_{\mathcal{B}} = [T(\mathbf{v}_n)]_{\mathcal{C}}.$$

But  $\mathbf{v}_1 = 1\mathbf{v}_1 + 0\mathbf{v}_2 + 0\mathbf{v}_3 + \dots + 0\mathbf{v}_n$  so

$$[\mathbf{v}_1]_{\mathcal{B}} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ \vdots \\ 0 \end{bmatrix}$$

which implies that

$$[T(\mathbf{v}_1)]_{\mathcal{C}} = A[\mathbf{v}_1]_{\mathcal{B}} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix} \begin{bmatrix} 1 \\ 0 \\ 0 \\ \vdots \\ 0 \end{bmatrix} =$$

We need  $A$  to satisfy

$$A[\mathbf{v}_1]_{\mathcal{B}} = [T(\mathbf{v}_1)]_{\mathcal{C}}, \quad A[\mathbf{v}_s]_{\mathcal{B}} = [T(\mathbf{v}_s)]_{\mathcal{C}}, \quad \dots, \quad A[\mathbf{v}_n]_{\mathcal{B}} = [T(\mathbf{v}_n)]_{\mathcal{C}}.$$

But  $\mathbf{v}_1 = 1\mathbf{v}_1 + 0\mathbf{v}_2 + 0\mathbf{v}_3 + \dots + 0\mathbf{v}_n$  so

$$[\mathbf{v}_1]_{\mathcal{B}} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ \vdots \\ 0 \end{bmatrix}$$

which implies that

$$[T(\mathbf{v}_1)]_{\mathcal{C}} = A[\mathbf{v}_1]_{\mathcal{B}} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix} \begin{bmatrix} 1 \\ 0 \\ 0 \\ \vdots \\ 0 \end{bmatrix} = \begin{bmatrix} a_{11} \\ a_{21} \\ \vdots \\ a_{m1} \end{bmatrix}.$$

$$A[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}$$

Similarly

$$[T(\mathbf{v}_2)]_{\mathcal{C}} = A[\mathbf{v}_2]_{\mathcal{B}} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix} \begin{bmatrix} 0 \\ 1 \\ 0 \\ \vdots \\ 0 \end{bmatrix} = \begin{bmatrix} a_{12} \\ a_{22} \\ \vdots \\ a_{m2} \end{bmatrix}.$$

⋮

$$[T(\mathbf{v}_n)]_{\mathcal{C}} = A[\mathbf{v}_n]_{\mathcal{B}} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix} \begin{bmatrix} 0 \\ 1 \\ 0 \\ \vdots \\ 0 \end{bmatrix} = \begin{bmatrix} a_{1n} \\ a_{2n} \\ \vdots \\ a_{mn} \end{bmatrix}.$$

$$A[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}$$

So the  $m \times n$  matrix that we want is

$$A = \begin{bmatrix} [T(\mathbf{v}_1)]_{\mathcal{C}} & [T(\mathbf{v}_2)]_{\mathcal{C}} & \cdots & [T(\mathbf{v}_n)]_{\mathcal{C}} \end{bmatrix}.$$

$$A[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}$$

So the  $m \times n$  matrix that we want is

$$A = \begin{bmatrix} [T(\mathbf{v}_1)]_{\mathcal{C}} & [T(\mathbf{v}_2)]_{\mathcal{C}} & \cdots & [T(\mathbf{v}_n)]_{\mathcal{C}} \end{bmatrix}.$$

### Definition

This matrix is called the *matrix for  $T$  relative to the bases  $\mathcal{B}$  and  $\mathcal{C}$*  and is denoted by  $[T]_{\mathcal{C}, \mathcal{B}}$ .

# Matrices for

$$[T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

## Remark

The linear transformation

$$\begin{array}{ccc} T : & V & \rightarrow W \\ & \text{basis } \mathcal{B} & \text{basis } \mathcal{C} \end{array}$$

has matrix

$$[T]_{\mathcal{C}, \mathcal{B}}.$$

# Matrices for

$$[T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

## Remark

The linear transformation

$$\begin{array}{ccc} T : & V & \rightarrow W \\ & \text{basis } \mathcal{B} & \text{basis } \mathcal{C} \end{array}$$

has matrix

$$[T]_{\mathcal{C}, \mathcal{B}}.$$

We will use the formula

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}.$$

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

## Example

I leave it for you to prove that if  $T_A : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a matrix transformation ( $T_A(\mathbf{x}) = A\mathbf{x}$ ) and if  $\mathcal{B}$  and  $\mathcal{C}$  are the standard bases, then

$$[T_A]_{\mathcal{C}, \mathcal{B}} = A.$$

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

## Example

I leave it for you to prove that if  $T_A : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a matrix transformation ( $T_A(\mathbf{x}) = A\mathbf{x}$ ) and if  $\mathcal{B}$  and  $\mathcal{C}$  are the standard bases, then

$$[T_A]_{\mathcal{C}, \mathcal{B}} = A.$$

## Remark

If we are using the standard bases on both  $V$  and  $W$ , then we can write the matrix for  $T$  as just

$$[T].$$

This is called the *standard matrix* for  $T$ .

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

## Example

Let  $T : \mathbb{P}^1 \rightarrow \mathbb{P}^2$  be the linear transformation defined by

$$T(\mathbf{p}) = x\mathbf{p}.$$

(For example, if  $\mathbf{p} = 1 + x$ , then  $T(\mathbf{p}) = x + x^2$ .)

Find the matrix for  $T$  with respect to the bases

$$\mathcal{B} = \{\mathbf{v}_1 = 1, \mathbf{v}_2 = x\} \quad \text{and} \quad \mathcal{C} = \{\mathbf{w}_1 = 1, \mathbf{w}_2 = x, \mathbf{w}_3 = x^2\}.$$

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

## Example

Let  $T : \mathbb{P}^1 \rightarrow \mathbb{P}^2$  be the linear transformation defined by

$$T(\mathbf{p}) = x\mathbf{p}.$$

(For example, if  $\mathbf{p} = 1 + x$ , then  $T(\mathbf{p}) = x + x^2$ .)

Find the matrix for  $T$  with respect to the bases

$$\mathcal{B} = \{\mathbf{v}_1 = 1, \mathbf{v}_2 = x\} \quad \text{and} \quad \mathcal{C} = \{\mathbf{w}_1 = 1, \mathbf{w}_2 = x, \mathbf{w}_3 = x^2\}.$$

First we calculate that

$$T(\mathbf{v}_1) = T(1) = (x)(1) = x = 0\mathbf{w}_1 + 1\mathbf{w}_2 + 0\mathbf{w}_3$$

$$T(\mathbf{v}_2) = T(x) = (x)(x) = x^2 = 0\mathbf{w}_1 + 0\mathbf{w}_2 + 1\mathbf{w}_3.$$

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

$$\begin{aligned} T(\mathbf{v}_1) &= T(1) = (x)(1) = x = 0\mathbf{w}_1 + 1\mathbf{w}_2 + 0\mathbf{w}_3 \\ T(\mathbf{v}_2) &= T(x) = (x)(x) = x^2 = 0\mathbf{w}_1 + 0\mathbf{w}_2 + 1\mathbf{w}_3. \end{aligned}$$

Therefore the coordinates of  $T(\mathbf{v}_1)$  and  $T(\mathbf{v}_2)$  with respect to  $\mathcal{C}$  are

$$[T(\mathbf{v}_1)]_{\mathcal{C}} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \quad \text{and} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}.$$

---

<sup>1</sup>with respect to

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

$$\begin{aligned} T(\mathbf{v}_1) &= T(1) = (x)(1) = x = 0\mathbf{w}_1 + 1\mathbf{w}_2 + 0\mathbf{w}_3 \\ T(\mathbf{v}_2) &= T(x) = (x)(x) = x^2 = 0\mathbf{w}_1 + 0\mathbf{w}_2 + 1\mathbf{w}_3. \end{aligned}$$

Therefore the coordinates of  $T(\mathbf{v}_1)$  and  $T(\mathbf{v}_2)$  with respect to  $\mathcal{C}$  are

$$[T(\mathbf{v}_1)]_{\mathcal{C}} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \quad \text{and} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}.$$

Hence the matrix for  $T$  wrt<sup>1</sup>  $\mathcal{B}$  and  $\mathcal{C}$  is

$$[T]_{\mathcal{C}, \mathcal{B}} = \begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{bmatrix}.$$

---

<sup>1</sup>with respect to

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

## Example

Let  $T : \mathbb{R}^2 \rightarrow \mathbb{R}^3$  be the linear transformation defined by

$$T \begin{pmatrix} [x_1] \\ [x_2] \end{pmatrix} = \begin{bmatrix} x_2 \\ -5x_1 + 13x_2 \\ -7x_1 + 16x_2 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -5 & 13 \\ -7 & 16 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}.$$

Find the matrix for  $T$  wrt the bases  $\mathcal{B} = \{\mathbf{v}_1, \mathbf{v}_2\}$  for  $\mathbb{R}^2$ , and  $\mathcal{C} = \{\mathbf{w}_1, \mathbf{w}_2, \mathbf{w}_3\}$  for  $\mathbb{R}^3$ , where

$$\mathbf{u}_1 = \begin{bmatrix} 3 \\ 1 \end{bmatrix}, \quad \mathbf{u}_2 = \begin{bmatrix} 5 \\ 2 \end{bmatrix}, \quad \mathbf{w}_1 = \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}, \quad \mathbf{w}_2 = \begin{bmatrix} -1 \\ 2 \\ 2 \end{bmatrix}, \quad \mathbf{w}_3 = \begin{bmatrix} 0 \\ 1 \\ 2 \end{bmatrix}.$$

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

$$T \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{bmatrix} x_2 \\ -5x_1 + 13x_2 \\ -7x_1 + 16x_2 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -5 & 13 \\ -7 & 16 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

Note, if we were using the standard bases on  $\mathbb{R}^2$  and  $\mathbb{R}^3$ , then the answer would just be the standard matrix

$$[T] = \begin{bmatrix} 0 & 1 \\ -5 & 13 \\ -7 & 16 \end{bmatrix}.$$

But we are using different bases, so this is not the answer.

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_c \quad [T(\mathbf{v}_2)]_c \quad \cdots \quad [T(\mathbf{v}_n)]_c]$$

$$T \left( \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \right) = \begin{bmatrix} x_2 \\ -5x_1 + 13x_2 \\ -7x_1 + 16x_2 \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -5 & 13 \\ -7 & 16 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

$$\mathbf{u}_1 = \begin{bmatrix} 3 \\ 1 \end{bmatrix}, \quad \mathbf{u}_2 = \begin{bmatrix} 5 \\ 2 \end{bmatrix}, \quad \mathbf{w}_1 = \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}, \quad \mathbf{w}_2 = \begin{bmatrix} -1 \\ 2 \\ 2 \end{bmatrix}, \quad \mathbf{w}_3 = \begin{bmatrix} 0 \\ 1 \\ 2 \end{bmatrix}$$

We start by calculating

$$T(\mathbf{v}_1) = \begin{bmatrix} 0 & 1 \\ -5 & 13 \\ -7 & 16 \end{bmatrix} \begin{bmatrix} 3 \\ 1 \end{bmatrix} = \begin{bmatrix} 1 \\ -2 \\ -5 \end{bmatrix} = \mathbf{w}_1 - 2\mathbf{w}_3$$

$$T(\mathbf{v}_2) = \begin{bmatrix} 0 & 1 \\ -5 & 13 \\ -7 & 16 \end{bmatrix} \begin{bmatrix} 5 \\ 2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ -3 \end{bmatrix} = 3\mathbf{w}_1 + \mathbf{w}_2 - \mathbf{w}_3$$

(please check).

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

$$T(\mathbf{v}_1) = \mathbf{w}_1 - 2\mathbf{w}_3 \qquad \qquad T(\mathbf{v}_2) = 3\mathbf{w}_1 + \mathbf{w}_2 - \mathbf{w}_3$$

Therefore

$$[T(\mathbf{v}_1)]_{\mathcal{C}} = \begin{bmatrix} 1 \\ 0 \\ -2 \end{bmatrix} \quad \text{and} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} = \begin{bmatrix} 3 \\ 1 \\ -1 \end{bmatrix}.$$

$$[T]_{\mathcal{C}, \mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{C}}, \quad [T]_{\mathcal{C}, \mathcal{B}} = [[T(\mathbf{v}_1)]_{\mathcal{C}} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} \quad \cdots \quad [T(\mathbf{v}_n)]_{\mathcal{C}}]$$

$$T(\mathbf{v}_1) = \mathbf{w}_1 - 2\mathbf{w}_3 \qquad \qquad T(\mathbf{v}_2) = 3\mathbf{w}_1 + \mathbf{w}_2 - \mathbf{w}_3$$

Therefore

$$[T(\mathbf{v}_1)]_{\mathcal{C}} = \begin{bmatrix} 1 \\ 0 \\ -2 \end{bmatrix} \quad \text{and} \quad [T(\mathbf{v}_2)]_{\mathcal{C}} = \begin{bmatrix} 3 \\ 1 \\ -1 \end{bmatrix}.$$

Hence the matrix for  $T$  wrt  $\mathcal{B}$  and  $\mathcal{C}$  is

$$[T]_{\mathcal{C}, \mathcal{B}} = \begin{bmatrix} [T(\mathbf{v}_1)]_{\mathcal{C}} & [T(\mathbf{v}_2)]_{\mathcal{C}} \end{bmatrix} = \begin{bmatrix} 1 & 3 \\ 0 & 1 \\ -2 & -1 \end{bmatrix}.$$

# Matrices for Linear Transformations

Remark

$$[T] = \begin{bmatrix} 0 & 1 \\ -5 & 13 \\ -7 & 16 \end{bmatrix} \quad \text{and} \quad [T]_{\mathcal{C}, \mathcal{B}} = \begin{bmatrix} 1 & 3 \\ 0 & 1 \\ -2 & -1 \end{bmatrix}$$

are two different matrices for the same linear transformation.

## Linear Operators

Recall that if  $V = W$ , then the linear transformation  $T : V \rightarrow V$  is called a linear operator.

(If we are using the same basis  $\mathcal{B}$  on both the domain and the target of  $T$ , then) instead of writing  $[T]_{\mathcal{B}, \mathcal{B}}$  we just write

$$[T]_{\mathcal{B}}.$$

## Linear Operators

Recall that if  $V = W$ , then the linear transformation  $T : V \rightarrow V$  is called a linear operator.

(If we are using the same basis  $\mathcal{B}$  on both the domain and the target of  $T$ , then) instead of writing  $[T]_{\mathcal{B}, \mathcal{B}}$  we just write

$$[T]_{\mathcal{B}}.$$

The formulae are then

$$[T]_{\mathcal{B}} = \begin{bmatrix} [T(\mathbf{v}_1)]_{\mathcal{B}} & [T(\mathbf{v}_2)]_{\mathcal{B}} & \cdots & [T(\mathbf{v}_n)]_{\mathcal{B}} \end{bmatrix}$$

and

$$[T]_{\mathcal{B}}[\mathbf{x}]_{\mathcal{B}} = [T(\mathbf{x})]_{\mathcal{B}}.$$

## Identity Operators

### Example

Let  $V$  be a finite dimensional vector space and let  $\mathcal{B} = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$  be a basis for  $V$ . Consider the identity operator  $I : V \rightarrow V$ ,  $I(\mathbf{x}) = \mathbf{x}$ .

## Identity Operators

### Example

Let  $V$  be a finite dimensional vector space and let  $\mathcal{B} = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$  be a basis for  $V$ . Consider the identity operator  $I : V \rightarrow V$ ,  $I(\mathbf{x}) = \mathbf{x}$ . Note that

$$I(\mathbf{v}_1) = \mathbf{v}_1, \quad I(\mathbf{v}_2) = \mathbf{v}_2, \quad \dots, \quad I(\mathbf{v}_n) = \mathbf{v}_n.$$

## Identity Operators

### Example

Let  $V$  be a finite dimensional vector space and let  $\mathcal{B} = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$  be a basis for  $V$ . Consider the identity operator  $I : V \rightarrow V$ ,  $I(\mathbf{x}) = \mathbf{x}$ . Note that

$$I(\mathbf{v}_1) = \mathbf{v}_1, \quad I(\mathbf{v}_2) = \mathbf{v}_2, \quad \dots, \quad I(\mathbf{v}_n) = \mathbf{v}_n.$$

Hence

$$[I]_{\mathcal{B}} = \begin{bmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \vdots & & \vdots \\ 0 & 0 & 0 & \cdots & 1 \end{bmatrix} = I_n.$$

# Matrices for Linear Transformations

## Example

Let  $T : \mathbb{P}^2 \rightarrow \mathbb{P}^2$  be the linear operator defined by

$$T(\mathbf{p}) = \mathbf{p}(3x - 5).$$

For example, if  $\mathbf{p} = 2x + x^2$ , then

$$T(\mathbf{p}) = \mathbf{p}(3x - 5) = 2(3x - 5) + (3x - 5)^2.$$

# Matrices for Linear Transformations

## Example

Let  $T : \mathbb{P}^2 \rightarrow \mathbb{P}^2$  be the linear operator defined by

$$T(\mathbf{p}) = \mathbf{p}(3x - 5).$$

For example, if  $\mathbf{p} = 2x + x^2$ , then

$$T(\mathbf{p}) = \mathbf{p}(3x - 5) = 2(3x - 5) + (3x - 5)^2.$$

- 1 Find  $[T]_{\mathcal{B}}$  where  $\mathcal{B} = \{1, x, x^2\}$ .
- 2 Use this to calculate  $T(1 + 2x + 3x^2)$ .

# Matrices for Linear Transformations

1 Since

$$T(1) = 1, \quad T(x) = (3x-5), \quad T(x^2) = (3x-5)^2 = 9x^2 - 30x + 25$$

we have

$$[T(1)]_{\mathcal{B}} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \quad [T(x)]_{\mathcal{B}} = \begin{bmatrix} -5 \\ 3 \\ 0 \end{bmatrix}, \quad [T(x^2)]_{\mathcal{B}} = \begin{bmatrix} 25 \\ -30 \\ 9 \end{bmatrix}.$$

# Matrices for Linear Transformations

1 Since

$$T(1) = 1, \quad T(x) = (3x-5), \quad T(x^2) = (3x-5)^2 = 9x^2 - 30x + 25$$

we have

$$[T(1)]_{\mathcal{B}} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \quad [T(x)]_{\mathcal{B}} = \begin{bmatrix} -5 \\ 3 \\ 0 \end{bmatrix}, \quad [T(x^2)]_{\mathcal{B}} = \begin{bmatrix} 25 \\ -30 \\ 9 \end{bmatrix}.$$

Hence

$$[T]_{\mathcal{B}} = \begin{bmatrix} 1 & -5 & 25 \\ 0 & 3 & -30 \\ 0 & 0 & 9 \end{bmatrix}.$$

$$[T]_{\mathcal{B}} = \begin{bmatrix} 1 & -5 & 25 \\ 0 & 3 & -30 \\ 0 & 0 & 9 \end{bmatrix}$$

- 2 The vector  $\mathbf{p} = 1 + 2x + 3x^2$  has coordinate vector

$$[\mathbf{p}]_{\mathcal{B}} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}.$$

$$[T]_{\mathcal{B}} = \begin{bmatrix} 1 & -5 & 25 \\ 0 & 3 & -30 \\ 0 & 0 & 9 \end{bmatrix}$$

- 2 The vector  $\mathbf{p} = 1 + 2x + 3x^2$  has coordinate vector

$$[\mathbf{p}]_{\mathcal{B}} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}.$$

Thus

$$[T(\mathbf{p})]_{\mathcal{B}} = [T]_{\mathcal{B}} [\mathbf{p}]_{\mathcal{B}} = \begin{bmatrix} 1 & -5 & 25 \\ 0 & 3 & -30 \\ 0 & 0 & 9 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} = \begin{bmatrix} 66 \\ -84 \\ 27 \end{bmatrix}.$$

$$[T]_{\mathcal{B}} = \begin{bmatrix} 1 & -5 & 25 \\ 0 & 3 & -30 \\ 0 & 0 & 9 \end{bmatrix}$$

- 2 The vector  $\mathbf{p} = 1 + 2x + 3x^2$  has coordinate vector

$$[\mathbf{p}]_{\mathcal{B}} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}.$$

Thus

$$[T(\mathbf{p})]_{\mathcal{B}} = [T]_{\mathcal{B}} [\mathbf{p}]_{\mathcal{B}} = \begin{bmatrix} 1 & -5 & 25 \\ 0 & 3 & -30 \\ 0 & 0 & 9 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} = \begin{bmatrix} 66 \\ -84 \\ 27 \end{bmatrix}.$$

Therefore

$$T(1 + 2x + 3x^2) = 66 - 84x + 27x^2.$$

## Compositions and Inverses

### Theorem

If  $T_1 : U \rightarrow V$  and  $T_2 : V \rightarrow W$  are linear transformations, and if  $\mathcal{A}$ ,  $\mathcal{B}$  and  $\mathcal{C}$  are bases for  $U$ ,  $V$ , and  $W$ , respectively, then

$$[T_2 \circ T_1]_{\mathcal{C}, \mathcal{A}} = [T_2]_{\mathcal{C}, \mathcal{B}} [T_1]_{\mathcal{B}, \mathcal{A}}.$$

## Theorem

If  $T : V \rightarrow V$  is a linear operator, and if  $\mathcal{B}$  is a basis for  $V$ , then the following are equivalent:

- 1  $T$  is one-to-one.
- 2  $[T]_{\mathcal{B}}$  is invertible.

## Theorem

If  $T : V \rightarrow V$  is a linear operator, and if  $\mathcal{B}$  is a basis for  $V$ , then the following are equivalent:

- 1  $T$  is one-to-one.
- 2  $[T]_{\mathcal{B}}$  is invertible.

Moreover, when these equivalent conditions hold,

$$[T^{-1}]_{\mathcal{B}} = [T]_{\mathcal{B}}^{-1}$$

# Matrices for Linear Transformations

## Example (Composition)

Let  $T_1 : \mathbb{P}^1 \rightarrow \mathbb{P}^2$  and  $T_2 : \mathbb{P}^2 \rightarrow \mathbb{P}^2$  be defined by

$$T_1(\mathbf{p}) = x\mathbf{p} \quad \text{and} \quad T_2(\mathbf{p}) = \mathbf{p}(3x - 5).$$

Find the matrix of  $T_2 \circ T_1$  wrt to the standard bases on  $\mathbb{P}^1$  and  $\mathbb{P}^2$ .

Let

$$\mathcal{B} = \{1, x\} \quad \text{and} \quad \mathcal{C} = \{1, x, x^2\}.$$

# Matrices for Linear Transformations

## Example (Composition)

Let  $T_1 : \mathbb{P}^1 \rightarrow \mathbb{P}^2$  and  $T_2 : \mathbb{P}^2 \rightarrow \mathbb{P}^2$  be defined by

$$T_1(\mathbf{p}) = x\mathbf{p} \quad \text{and} \quad T_2(\mathbf{p}) = \mathbf{p}(3x - 5).$$

Find the matrix of  $T_2 \circ T_1$  wrt to the standard bases on  $\mathbb{P}^1$  and  $\mathbb{P}^2$ .

Let

$$\mathcal{B} = \{1, x\} \quad \text{and} \quad \mathcal{C} = \{1, x, x^2\}.$$

We have seen today that

$$[T_1]_{\mathcal{C}, \mathcal{B}} = \begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \text{and} \quad [T_2]_{\mathcal{C}} = \begin{bmatrix} 1 & -5 & 25 \\ 0 & 3 & -30 \\ 0 & 0 & 9 \end{bmatrix}.$$

# Matrices for Linear Transformations

It follows that

$$[T_2 \circ T_1]_{\mathcal{C}, \mathcal{B}} = [T_2]_{\mathcal{C}} [T_1]_{\mathcal{C}, \mathcal{B}} = \begin{bmatrix} 1 & -5 & 25 \\ 0 & 3 & -30 \\ 0 & 0 & 9 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} -5 & 25 \\ 3 & -30 \\ 0 & 9 \end{bmatrix}$$

# Break

# Similarity

# Similarity

Consider the matrix operator  $T_A : \mathbb{R}^2 \rightarrow \mathbb{R}^2$  where

$$A = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix}.$$

The matrix for  $T_A$  relative to the standard basis  $\mathcal{B} = \{\mathbf{e}_1, \mathbf{e}_2\}$  for  $\mathbb{R}^2$  is

$$[T_A] = [T_A]_{\mathcal{B}} = A = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix}.$$

Consider the matrix operator  $T_A : \mathbb{R}^2 \rightarrow \mathbb{R}^2$  where

$$A = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix}.$$

The matrix for  $T_A$  relative to the standard basis  $\mathcal{B} = \{\mathbf{e}_1, \mathbf{e}_2\}$  for  $\mathbb{R}^2$  is

$$[T_A] = [T_A]_{\mathcal{B}} = A = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix}.$$

I want to calculate the matrix for the same operator  $T_A$  relative to a different basis.

## Similarity

$$A = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix}$$

Namely, the basis  $\mathcal{C} = \{\mathbf{v}_1, \mathbf{v}_2\}$  for  $\mathbb{R}^2$  where

$$\mathbf{v}_1 = \begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \text{and} \quad \mathbf{v}_2 = \begin{bmatrix} 1 \\ 2 \end{bmatrix}.$$

# Similarity

$$A = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix}$$

Namely, the basis  $\mathcal{C} = \{\mathbf{v}_1, \mathbf{v}_2\}$  for  $\mathbb{R}^2$  where

$$\mathbf{v}_1 = \begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \text{and} \quad \mathbf{v}_2 = \begin{bmatrix} 1 \\ 2 \end{bmatrix}.$$

Since

$$T_A(\mathbf{v}_1) = A\mathbf{v}_1 = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix} = 2\mathbf{v}_1$$

and

$$T_A(\mathbf{v}_2) = A\mathbf{v}_2 = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \end{bmatrix} = \begin{bmatrix} 3 \\ 6 \end{bmatrix} = 3\mathbf{v}_2$$

# Similarity

$$A = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix}$$

Namely, the basis  $\mathcal{C} = \{\mathbf{v}_1, \mathbf{v}_2\}$  for  $\mathbb{R}^2$  where

$$\mathbf{v}_1 = \begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \text{and} \quad \mathbf{v}_2 = \begin{bmatrix} 1 \\ 2 \end{bmatrix}.$$

Since

$$T_A(\mathbf{v}_1) = A\mathbf{v}_1 = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix} = 2\mathbf{v}_1$$

and

$$T_A(\mathbf{v}_2) = A\mathbf{v}_2 = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \end{bmatrix} = \begin{bmatrix} 3 \\ 6 \end{bmatrix} = 3\mathbf{v}_2$$

it follows that

$$[T_A(\mathbf{v}_1)]_{\mathcal{C}} = \begin{bmatrix} 2 \\ 0 \end{bmatrix} \quad \text{and} \quad [T_A(\mathbf{v}_2)]_{\mathcal{C}} = \begin{bmatrix} 0 \\ 3 \end{bmatrix}.$$

Therefore the matrix for  $T_A$  relative to the basis  $\mathcal{C}$  is

$$[T_A]_{\mathcal{C}} = \begin{bmatrix} 2 & 0 \\ 0 & 3 \end{bmatrix}.$$

# Similarity

Compare these two matrices

$$[T_A]_{\mathcal{B}} = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix} \quad [T_A]_{\mathcal{C}} = \begin{bmatrix} 2 & 0 \\ 0 & 3 \end{bmatrix}.$$

- The determinant of both matrices is 6.
- Both matrices are invertible.
- The trace of both matrices is 5.
- The latter matrix is diagonal and diagonal matrices are easier to deal with.

## Definition

$$B \text{ is similar to } A \implies A \text{ is similar to } B$$

## Proof.

Suppose that  $B = P^{-1}AP$ . Let  $Q = P^{-1}$ . Then  $B = QAQ^{-1}$  which rearranges to  $A = Q^{-1}BQ$ . Hence  $A$  is similar to  $B$ .  $\square$

## Theorem

*If  $A$  and  $B$  are similar matrices, then*

$$\det(A) = \det(B).$$

# Similarity

## Theorem

If  $A$  and  $B$  are similar matrices, then

$$\det(A) = \det(B).$$

## Proof.

If  $B = P^{-1}AP$ , then

$$\begin{aligned}\det(B) &= \det(P^{-1}AP) = \det(P^{-1})\det(A)\det(P) \\ &= \frac{1}{\det(P)}\det(A)\det(P) = \det(A).\end{aligned}$$

## Lemma

*If  $A$  and  $B$  are square matrices of the same size, then*

$$\text{tr}(AB) = \text{tr}(BA)$$

# Similarity

$$\begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} & \cdots & b_{1n} \\ b_{21} & b_{22} & \cdots & b_{2n} \\ \vdots & \vdots & & \vdots \\ b_{n1} & b_{n2} & \cdots & b_{nn} \end{bmatrix} = \begin{bmatrix} (AB)_{11} & ? & \cdots & ? \\ ? & (AB)_{22} & \cdots & ? \\ \vdots & \vdots & & \vdots \\ ? & ? & \cdots & (AB)_{nn} \end{bmatrix}$$

## Proof.

Recall that  $\text{tr}(AB)$  is the sum of the entries on the main diagonal of  $AB$ . If  $A$  and  $B$  are  $n \times n$  matrices, then

$$\begin{aligned} \text{tr}(AB) &= (AB)_{11} + (AB)_{22} + (AB)_{33} + \dots + (AB)_{nn} \\ &= \sum_{i=1}^n (AB)_{ii} \\ &= \end{aligned}$$

# Similarity

## Theorem

*Two matrices  $A$  and  $B$*

*represent the same  
linear operator*       $\iff$        *$A$  and  $B$  are similar.*

# Complex Numbers

## The Natural Numbers

The set

$$\mathbb{N} = \{1, 2, 3, 4, 5, 6, \dots\}$$

is called the set of *natural numbers*. These are the first numbers that children learn. For example

$2 \in \mathbb{N}$  means “2 is a natural number”

$7 \in \mathbb{N}$  means “7 is a natural number”

$\frac{1}{2} \notin \mathbb{N}$  means “ $\frac{1}{2}$  is **not** a natural number”

$0 \notin \mathbb{N}$  means “0 is **not** a natural number”

$-5 \notin \mathbb{N}$  means “−5 is **not** a natural number”

# Complex Numbers

In the natural numbers, we can do “+” and “ $\times$ ”

$$2 + 7 = 9 \in \mathbb{N}, \quad 2 \times 7 = 14 \in \mathbb{N}.$$

However we can not do “−” because

$$2 - 7 \notin \mathbb{N}.$$

# Complex Numbers

In the natural numbers, we can do “+” and “ $\times$ ”

$$2 + 7 = 9 \in \mathbb{N}, \quad 2 \times 7 = 14 \in \mathbb{N}.$$

However we can not do “−” because

$$2 - 7 \notin \mathbb{N}.$$

*So we invent new numbers!*

## The Integers

The set

$$\mathbb{Z} = \{\dots, -4, -3, -2, -1, 0, 1, 2, 3, 4, \dots\}$$

is called the set of *integers*. We use a  $\mathbb{Z}$  for the German word ‘zahlen’ (numbers).

## The Integers

The set

$$\mathbb{Z} = \{\dots, -4, -3, -2, -1, 0, 1, 2, 3, 4, \dots\}$$

is called the set of *integers*. We use a  $\mathbb{Z}$  for the German word ‘zahlen’ (numbers). In  $\mathbb{Z}$ , we can do “+”, “-” and “ $\times$ ” but we can not do “ $\div$ ”. For example  $3 \in \mathbb{Z}$ ,  $4 \in \mathbb{Z}$ ,  $-5 \in \mathbb{Z}$  and

$$3 + 4 \in \mathbb{Z}, \quad 3 - 4 \in \mathbb{Z}, \quad 3 \times 4 \in \mathbb{Z}, \quad 3 \div 4 \notin \mathbb{Z},$$

$$3 + (-5) \in \mathbb{Z}, \quad 3 - (-5) \in \mathbb{Z}, \quad 3 \times (-5) \in \mathbb{Z}, \quad 3 \div (-5) \notin \mathbb{Z}.$$

## The Integers

The set

$$\mathbb{Z} = \{\dots, -4, -3, -2, -1, 0, 1, 2, 3, 4, \dots\}$$

is called the set of *integers*. We use a  $\mathbb{Z}$  for the German word ‘zahlen’ (numbers). In  $\mathbb{Z}$ , we can do “+”, “-” and “ $\times$ ” but we can not do “ $\div$ ”. For example  $3 \in \mathbb{Z}$ ,  $4 \in \mathbb{Z}$ ,  $-5 \in \mathbb{Z}$  and

$$3 + 4 \in \mathbb{Z}, \quad 3 - 4 \in \mathbb{Z}, \quad 3 \times 4 \in \mathbb{Z}, \quad 3 \div 4 \notin \mathbb{Z},$$

$$3 + (-5) \in \mathbb{Z}, \quad 3 - (-5) \in \mathbb{Z}, \quad 3 \times (-5) \in \mathbb{Z}, \quad 3 \div (-5) \notin \mathbb{Z}.$$

*So we invent new numbers!*

## The Rational Numbers

The set

$$\mathbb{Q} = \{\text{all fractions}\} = \left\{ \frac{a}{b} \mid a, b \in \mathbb{Z} \text{ and } b \neq 0 \right\}$$

is called the set of *rational numbers*. We use a  $\mathbb{Q}$  for the word ‘quotient’.

## The Rational Numbers

The set

$$\mathbb{Q} = \{\text{all fractions}\} = \left\{ \frac{a}{b} \mid a, b \in \mathbb{Z} \text{ and } b \neq 0 \right\}$$

is called the set of *rational numbers*. We use a  $\mathbb{Q}$  for the word ‘quotient’. For example

$$0 = \frac{0}{1} \in \mathbb{Q}$$

$$\frac{100}{13} \in \mathbb{Q}$$

$$1 = \frac{1}{1} \in \mathbb{Q}$$

$$\sqrt{2} \notin \mathbb{Q}$$

$$\frac{3}{4} \in \mathbb{Q}$$

$$-4 = \frac{8}{-2} \in \mathbb{Q}$$

$$\pi \notin \mathbb{Q}$$

$$0.12345 = \frac{12345}{100000} \in \mathbb{Q}.$$

## The Rational Numbers

The set

$$\mathbb{Q} = \{\text{all fractions}\} = \left\{ \frac{a}{b} \mid a, b \in \mathbb{Z} \text{ and } b \neq 0 \right\}$$

is called the set of *rational numbers*. We use a  $\mathbb{Q}$  for the word ‘quotient’. For example

$$0 = \frac{0}{1} \in \mathbb{Q}$$

$$\frac{100}{13} \in \mathbb{Q}$$

$$1 = \frac{1}{1} \in \mathbb{Q}$$

$$\sqrt{2} \notin \mathbb{Q}$$

$$\frac{3}{4} \in \mathbb{Q}$$

$$-4 = \frac{8}{-2} \in \mathbb{Q}$$

$$\pi \notin \mathbb{Q}$$

$$0.12345 = \frac{12345}{100000} \in \mathbb{Q}.$$

In  $\mathbb{Q}$  we can do “+”, “-”, “ $\times$ ” and “ $\div$ (by a number  $\neq 0$ )”.

# Complex Numbers

Are we happy now?

# Complex Numbers

Are we happy now?

No!

Are we happy now?

No!

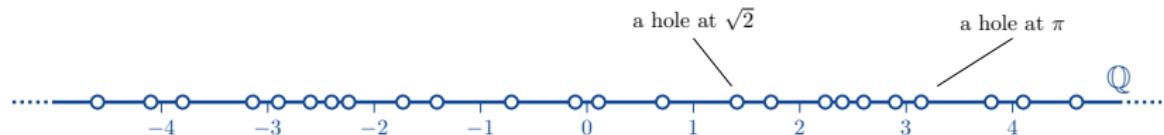

Why?

## Are we happy now?

No!

## Why?

Because if we draw all the rational numbers in a line, then the line has lots of holes in it. In fact,  $\mathbb{Q}$  has  $\infty$  many holes in it.

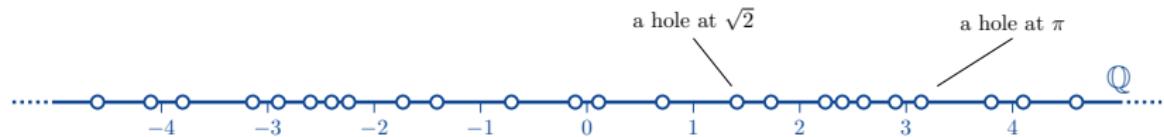

## Are we happy now?

No!

## Why?

Because if we draw all the rational numbers in a line, then the line has lots of holes in it. In fact,  $\mathbb{Q}$  has  $\infty$  many holes in it.

*So we invent new numbers!*

## The Real Numbers

The set

$$\mathbb{R} = \{\text{all numbers which can be written as a decimal}\}$$

is called the set of *real numbers*. For example

$$\begin{array}{ll} 0 = 0.0 \in \mathbb{R} & \frac{100}{13} = 7.692307\dots \in \mathbb{R} \\ \frac{23}{99} = 0.232323\dots \in \mathbb{R} & \sqrt{2} = 1.414213\dots \in \mathbb{R} \\ \frac{3}{4} = 0.75 \in \mathbb{R} & \frac{123}{999} = 0.123123\dots \in \mathbb{R} \\ \pi = 3.141592\dots \in \mathbb{R} & \frac{12345}{100000} = 0.12345 \in \mathbb{R}. \end{array}$$

## A.1 Real Numbers and the Real Line

The real numbers are complete – this means that if we draw all the real numbers in a line, then there are no holes in the line.

# Complex Numbers

Are we happy now?

# Complex Numbers

Are we happy now?

No!

Are we happy now?

No!

Why?

Are we happy now?

No!

Why?

Because not every polynomial has a root in  $\mathbb{R}$ . For example,  
there is no solution to

$$x^2 + 1 = 0$$

in  $\mathbb{R}$ .

Are we happy now?

No!

Why?

Because not every polynomial has a root in  $\mathbb{R}$ . For example,  
there is no solution to

$$x^2 + 1 = 0$$

in  $\mathbb{R}$ .

*So we invent new numbers!*

## Complex Numbers

We invent a new number called  $i$  which we say is the solution to

$$i^2 + 1 = 0.$$

## Complex Numbers

We invent a new number called  $i$  which we say is the solution to

$$i^2 + 1 = 0.$$

Or

$$i^2 = -1$$

## Complex Numbers

We invent a new number called  $i$  which we say is the solution to

$$i^2 + 1 = 0.$$

Or

$$i^2 = -1$$

Or

$$i = \sqrt{-1}.$$

# Complex Numbers

$i$  is a made up number. It was invented by humans.

# Complex Numbers

$i$  is a made up number. It was invented by humans.

But so are 0 and  $-3$  and  $\frac{7}{8}$  and  $\pi$ . Zero, negative numbers, fractions and irrational numbers are all inventions of humans.

# Complex Numbers

$i$  is a made up number. It was invented by humans.

But so are 0 and  $-3$  and  $\frac{7}{8}$  and  $\pi$ . Zero, negative numbers, fractions and irrational numbers are all inventions of humans.  
But we accept them because they are useful to us.

# Complex Numbers

$i$  is a made up number. It was invented by humans.

But so are 0 and  $-3$  and  $\frac{7}{8}$  and  $\pi$ . Zero, negative numbers, fractions and irrational numbers are all inventions of humans.  
But we accept them because they are useful to us.

$i$  is also useful to us.

# Complex Numbers

Now that we have  $i$ , we can start working with numbers like  $3 + 4i$ ,  $2 + 7i$ ,  $-12i$ , etc.

# Complex Numbers

Now that we have  $i$ , we can start working with numbers like  $3 + 4i$ ,  $2 + 7i$ ,  $-12i$ , etc.

## Definition

A *complex number* is any number that can be written as

$$a + bi$$

where  $i$  solves  $i^2 + 1 = 0$  and  $a, b \in \mathbb{R}$ .

## Definition

The set of all complex numbers is denoted by  $\mathbb{C}$ .

# Complex Numbers

$$z = \cancel{a} + \cancel{bi}$$

real part                      imaginary part

## Definition

$\operatorname{Re}(z) = a$  is called the *real* part of  $z$ , and  $\operatorname{Im}(z) = b$  is called the *imaginary* part of  $z$ .

$$z = \cancel{a} + \cancel{bi}$$

real part                      imaginary part

## Definition

$\operatorname{Re}(z) = a$  is called the *real* part of  $z$ , and  $\operatorname{Im}(z) = b$  is called the *imaginary* part of  $z$ .

## Example

- $-2 + 7i$  has real part  $-2$  and imaginary part  $7$ ;
- $7i$  has real part  $0$  and imaginary part  $7$ ; and
- $-2$  has real part  $-2$  and imaginary part  $0$ .

# Complex Numbers

## Definition

An *imaginary number* is a complex number  $a + bi$  where  $a = 0$ .

A *real number* is a complex number  $a + bi$  where  $b = 0$ .

$$4 + 2i \quad -3 - \sqrt{5}i \quad 1 - i$$

$$3 \quad \sqrt{5} \quad -12.2$$

$$-12.2i \quad \sqrt{2}i \quad 7i$$

# Complex Numbers

## Definition

An *imaginary number* is a complex number  $a + bi$  where  $a = 0$ .

A *real number* is a complex number  $a + bi$  where  $b = 0$ .

$$4 + 2i \quad -3 - \sqrt{5}i \quad 1 - i$$

real numbers

$$3 \quad \sqrt{5} \quad -12.2$$

$$-12.2i \quad \sqrt{2}i \quad 7i$$

# Complex Numbers

## Definition

An *imaginary number* is a complex number  $a + bi$  where  $a = 0$ .

A *real number* is a complex number  $a + bi$  where  $b = 0$ .

$$4 + 2i \quad -3 - \sqrt{5}i \quad 1 - i$$

real numbers

$$3 \quad \sqrt{5} \quad -12.2$$

imaginary numbers

$$-12.2i \quad \sqrt{2}i \quad 7i$$

# Complex Numbers

## Definition

An *imaginary number* is a complex number  $a + bi$  where  $a = 0$ .

A *real number* is a complex number  $a + bi$  where  $b = 0$ .

complex numbers

$4 + 2i$        $-3 - \sqrt{5}i$        $1 - i$

real numbers

$3$        $\sqrt{5}$        $-12.2$

imaginary numbers

$-12.2i$        $\sqrt{2}i$        $7i$

# Complex Numbers

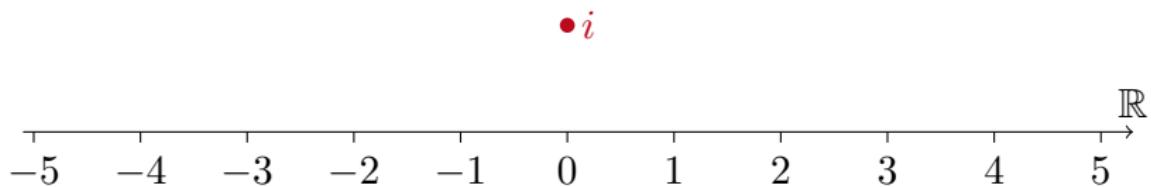

## Remark

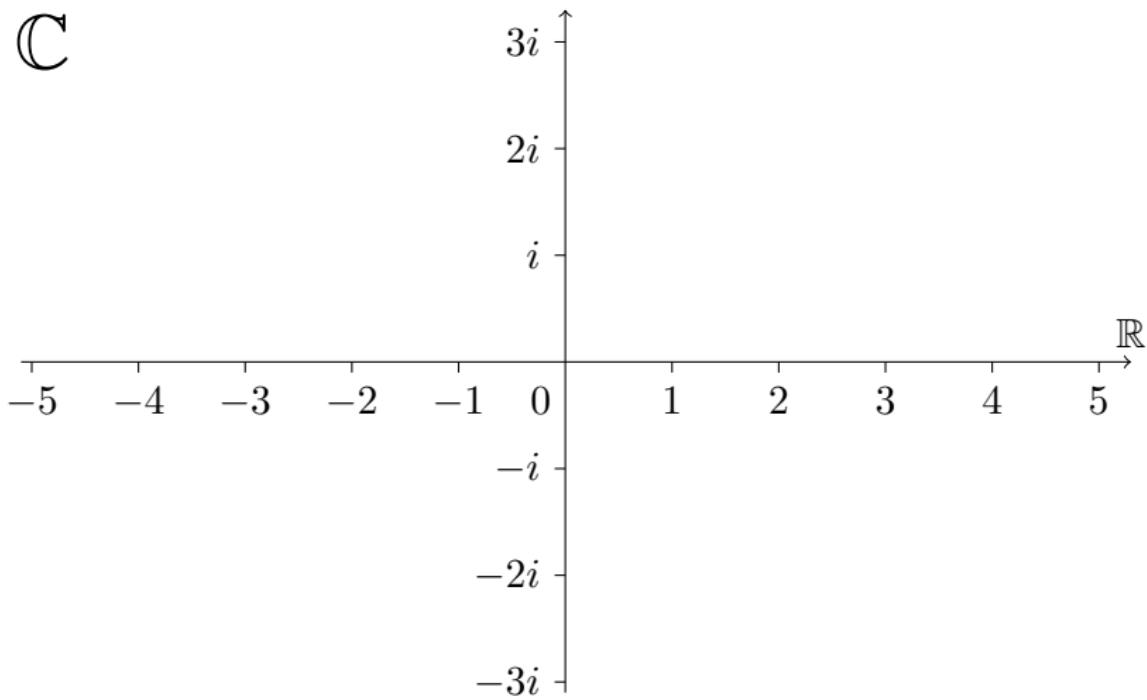

The names “real number” and “imaginary number” come from the 17th century.

These are really bad names because real numbers are just as imaginary, or made up, as imaginary numbers.

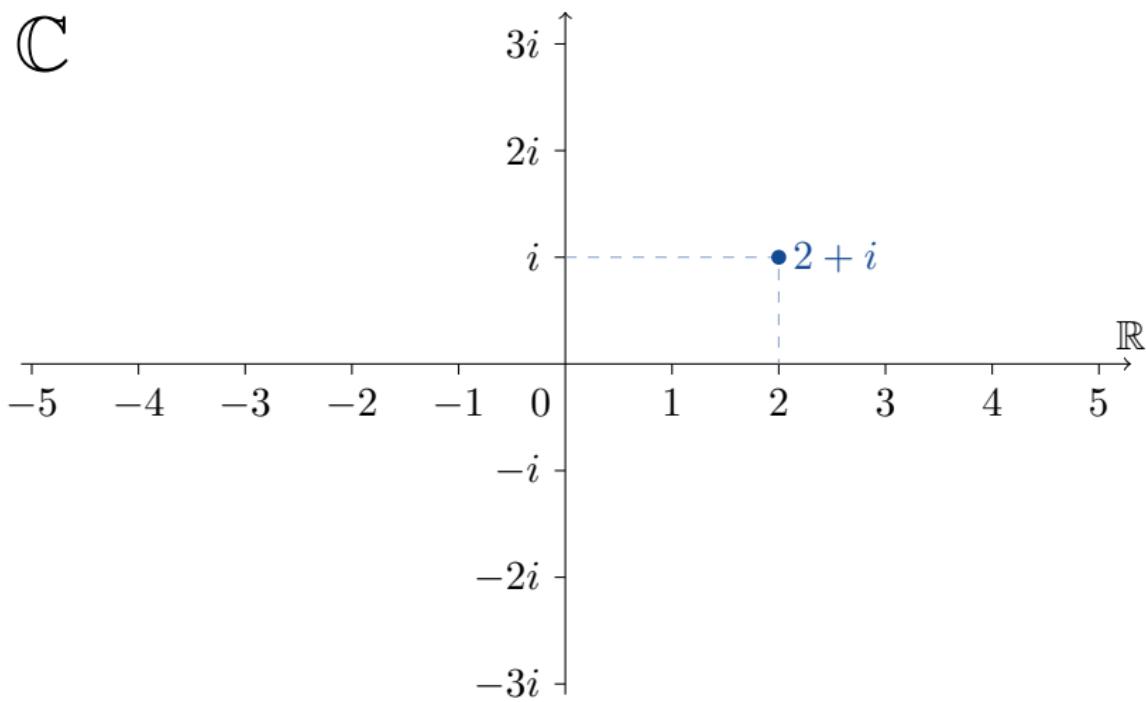

# Complex Numbers

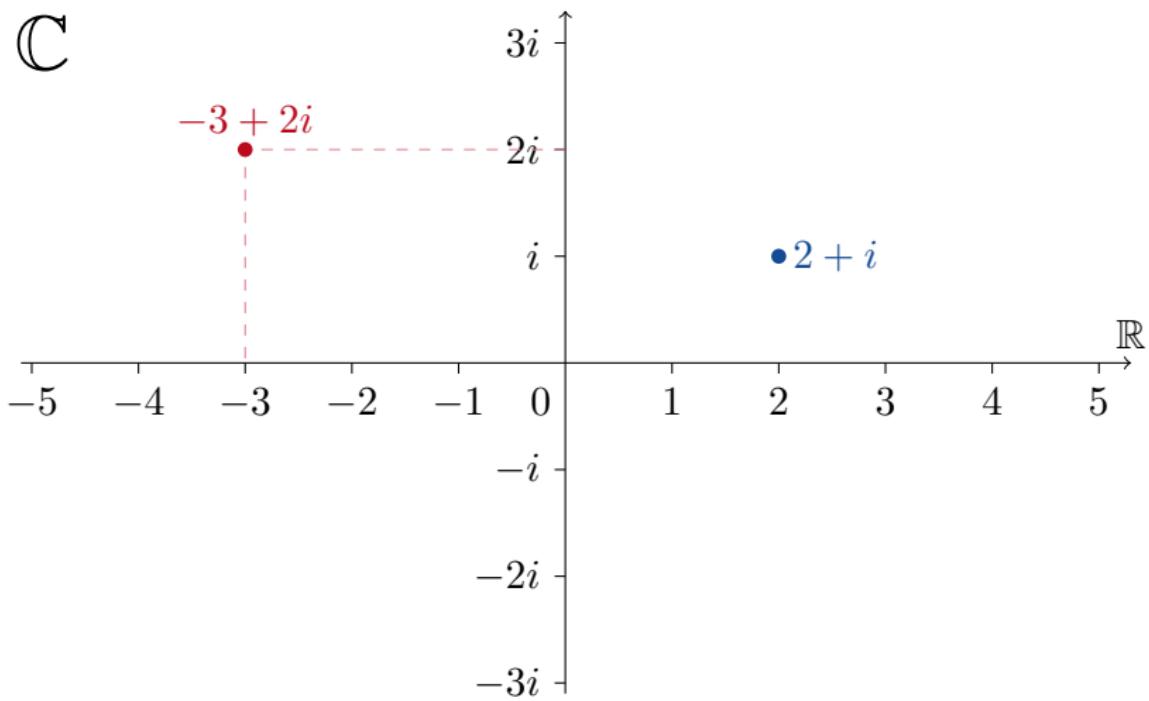

# Complex Numbers

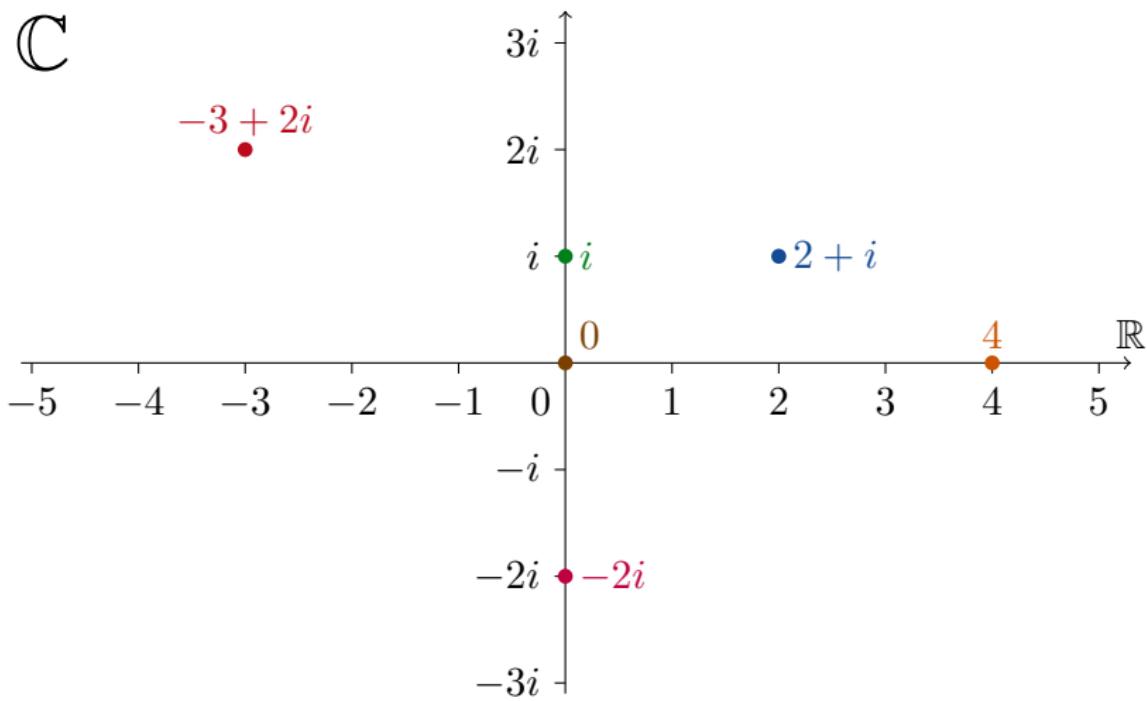

# Complex Numbers

# Complex Numbers

# Complex Numbers

# Complex Numbers

$$\sqrt{-9} = \sqrt{9(-1)} = \sqrt{9}\sqrt{-1} = 3i$$

# Complex Numbers

$$\sqrt{-9} = \sqrt{9(-1)} = \sqrt{9}\sqrt{-1} = 3i$$

$$(2 + 3i) + (1 - 6i) = (2 + 1) + (3i - 6i) = 3 - 3i$$

# Complex Numbers

$$\sqrt{-9} = \sqrt{9(-1)} = \sqrt{9}\sqrt{-1} = 3i$$

$$(2 + 3i) + (1 - 6i) = (2 + 1) + (3i - 6i) = 3 - 3i$$

$$\begin{aligned}(2 - i)(3 - 4i) &= (2)(3) + (2)(4i) + (-i)(3) + (-i)(-4i) \\&= 6 + 8i - 3i - 4i^2 \\&= 6 + 8i - 3i - 4(-1) \\&= 6 + 5i + 4 \\&= 10 + 5i\end{aligned}$$

# Complex Numbers

$$\frac{3-i}{2+i} =$$

# Complex Numbers

$$\frac{3-i}{2+i} = \frac{3-i}{2+i} \cdot \frac{\textcolor{brown}{2-i}}{\textcolor{brown}{2-i}}$$

# Complex Numbers

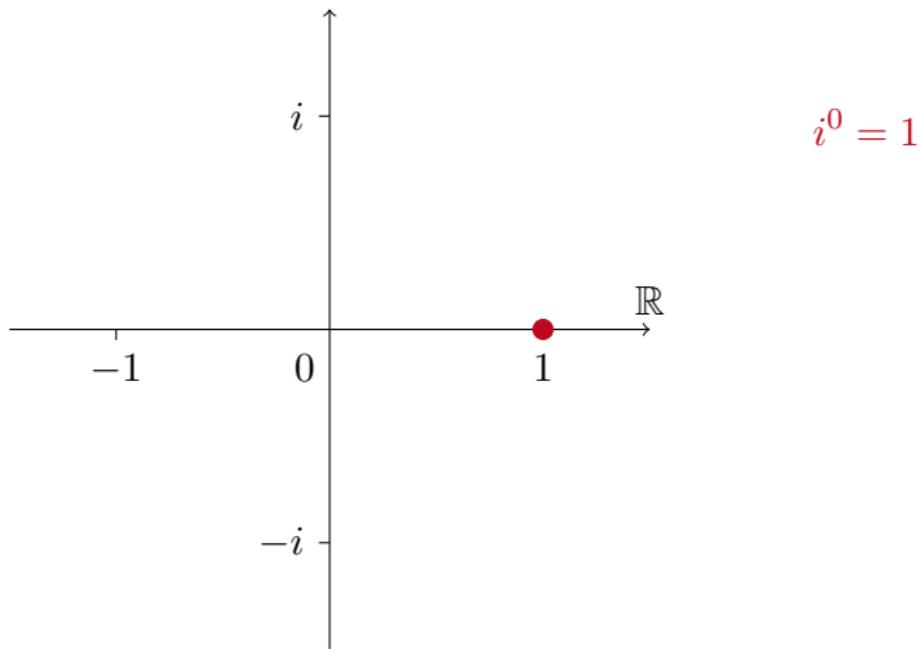

$$\frac{3-i}{2+i} = \frac{3-i}{2+i} \cdot \frac{\textcolor{brown}{2-i}}{\textcolor{brown}{2-i}} = \frac{6-3i-2i-1}{4-2i+2i+1}$$

# Complex Numbers

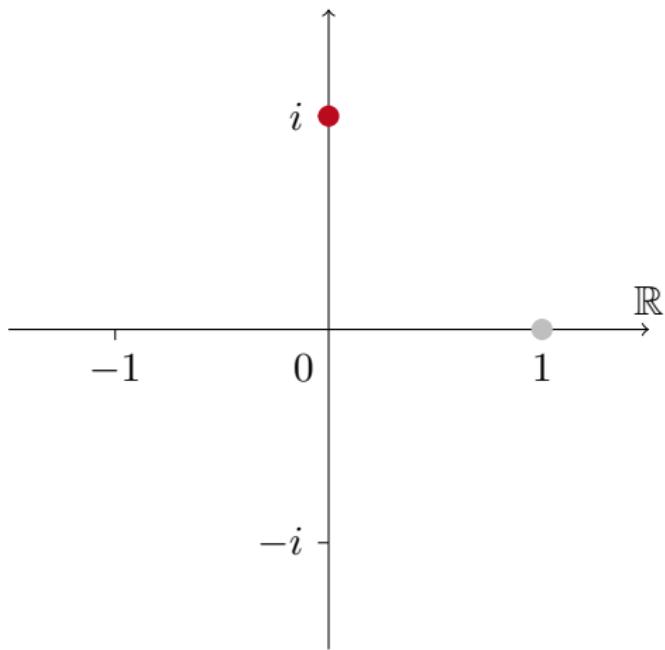

$$\frac{3-i}{2+i} = \frac{3-i}{2+i} \cdot \frac{\textcolor{brown}{2-i}}{\textcolor{brown}{2-i}} = \frac{6-3i-2i-1}{4-2i+2i+1} = \frac{5-5i}{5} = 1-i.$$

# Complex Numbers

- $z = a + bi$

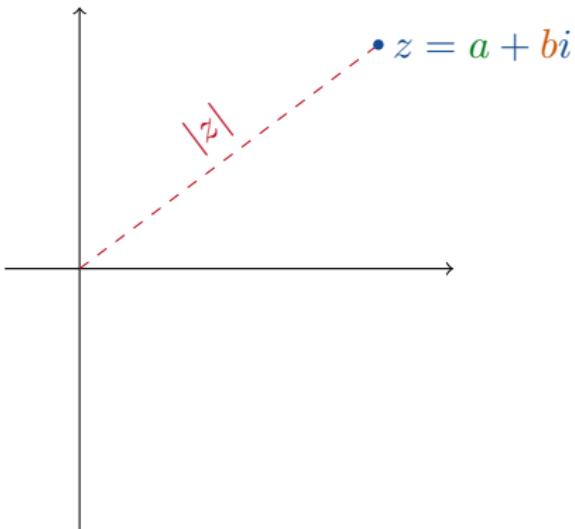

Definition

# Complex Numbers

Definition

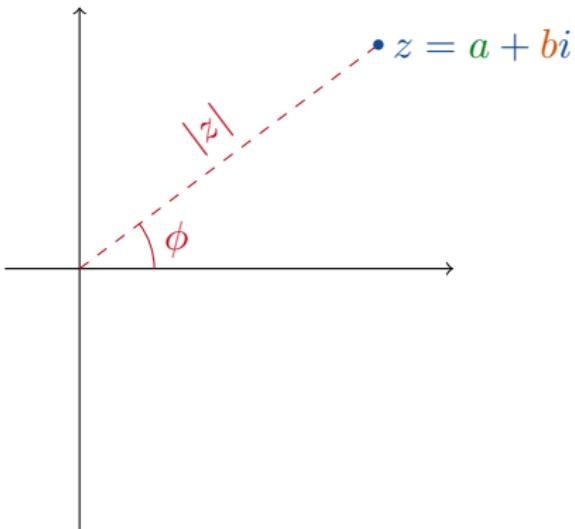

# Complex Numbers

## Definition

$|z| = \sqrt{a^2 + b^2}$  is called the *modulus* of  $z$ .

# Complex Numbers

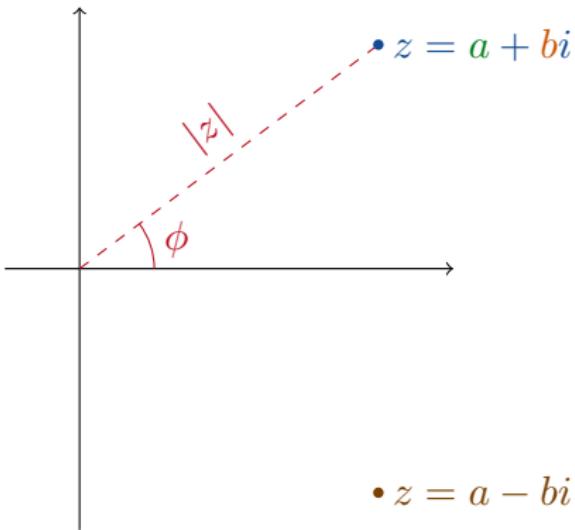

## Definition

$|z| = \sqrt{a^2 + b^2}$  is called the *modulus* of  $z$ .

The angle  $\arg(z) = \phi$  is called the *argument* of  $z$ .

# Complex Numbers

## Definition

$|z| = \sqrt{a^2 + b^2}$  is called the *modulus* of  $z$ .

The angle  $\arg(z) = \phi$  is called the *argument* of  $z$ .

$\bar{z} = a - bi$  is called the *complex conjugate* of  $z$ .

# Complex Numbers

## Remark

Note that

$$z\bar{z} = (a + bi)(a - bi) = a^2 + b^2 = |z|^2.$$

# Complex Numbers

## Remark

Note that

$$z\bar{z} = (a + bi)(a - bi) = a^2 + b^2 = |z|^2.$$

## Remark

$$z = \bar{z} \iff z \in \mathbb{R}$$

because

$$a + bi = a - bi \iff b = 0.$$

# Complex Numbers

Theorem

$$\overline{zw} = \bar{z}\bar{w}.$$

(you prove)

## Roots of polynomials

equation	solution	set
$x - 5 = 0$	$x = 5$	$\mathbb{N}$

## Roots of polynomials

equation	solution	set
$x - 5 = 0$	$x = 5$	$\mathbb{N}$
$x + 2 = 0$	$x = -2$	$\mathbb{Z}$

## Roots of polynomials

equation	solution	set
$x - 5 = 0$	$x = 5$	$\mathbb{N}$
$x + 2 = 0$	$x = -2$	$\mathbb{Z}$
$2x - 1 = 0$	$x = \frac{1}{2}$	$\mathbb{Q}$

## Roots of polynomials

equation	solution	set
$x - 5 = 0$	$x = 5$	$\mathbb{N}$
$x + 2 = 0$	$x = -2$	$\mathbb{Z}$
$2x - 1 = 0$	$x = \frac{1}{2}$	$\mathbb{Q}$
$x^2 - 5 = 0$	$x = \pm\sqrt{5}$	$\mathbb{R}$

## Roots of polynomials

equation	solution	set

$x^2 - 5 = 0$	$x = \pm\sqrt{5}$	$\mathbb{R}$
$x^2 + 1 = 0$	$x = i$	$\mathbb{C}$

**Question:** Are there any more numbers after  $\mathbb{C}$ ?

**Answer:** No.

# Complex Numbers

Theorem (The Fundamental Theorem of Algebra)

*Any polynomial with complex coefficients will only have complex roots.*

In other words: Using the five operations  $+$ ,  $-$ ,  $\times$ ,  $\div$  and  $a^b$ , we can not make any more numbers.  $\mathbb{C}$  is the end of the line.
