--	--	--

Example

Calculate $\int_0^{\frac{3}{2}} \frac{dx}{\sqrt{9 - x^2}}$.

Let $x = 3 \sin \theta$. $dx = 3 \cos \theta d\theta$ and $\sqrt{9 - x^2} = 3 \cos \theta$.

Moreover $x = 0 \implies \theta = \sin^{-1} \frac{x}{3} = \sin^{-1} 0 = 0$
 and $x = \frac{3}{2} \implies \theta = \sin^{-1} \frac{x}{3} = \sin^{-1} \frac{1}{2} = \frac{\pi}{6}$.

$x = a \tan \theta$ $\sqrt{a^2 + x^2} = a \sec \theta$ $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$	$x = a \sin \theta$ $\sqrt{a^2 - x^2} = a \cos \theta$ $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$	$x = a \sec \theta$ $\sqrt{x^2 - a^2} = a \tan \theta $ $\begin{cases} 0 \leq \theta < \frac{\pi}{2} & x \geq a \\ \frac{\pi}{2} < \theta \leq \pi & x \leq -a \end{cases}$
--	--	--

Example

Calculate $\int_0^{\frac{3}{2}} \frac{dx}{\sqrt{9 - x^2}}$.

Let $x = 3 \sin \theta$. $dx = 3 \cos \theta d\theta$ and $\sqrt{9 - x^2} = 3 \cos \theta$.

Moreover $x = 0 \implies \theta = \sin^{-1} \frac{x}{3} = \sin^{-1} 0 = 0$

and $x = \frac{3}{2} \implies \theta = \sin^{-1} \frac{x}{3} = \sin^{-1} \frac{1}{2} = \frac{\pi}{6}$. Therefore

$$\int_0^{\frac{3}{2}} \frac{dx}{\sqrt{9 - x^2}} = \int_0^{\frac{\pi}{6}} \frac{3 \cos \theta d\theta}{3 \cos \theta} = \int_0^{\frac{\pi}{6}} d\theta = \frac{\pi}{6}.$$

$x = a \tan \theta$	$x = a \sin \theta$	$x = a \sec \theta$
$\sqrt{a^2 + x^2} = a \sec \theta$	$\sqrt{a^2 - x^2} = a \cos \theta$	$\sqrt{x^2 - a^2} = a \tan \theta $
$-\frac{\pi}{2} < \theta < \frac{\pi}{2}$	$-\frac{\pi}{2} < \theta < \frac{\pi}{2}$	$\begin{cases} 0 \leq \theta < \frac{\pi}{2} & x \geq a \\ \frac{\pi}{2} < \theta \leq \pi & x \leq -a \end{cases}$

Example

Calculate $\int_0^{\frac{3}{2}} \frac{dx}{\sqrt{9 - x^2}}$.

Let $x = 3 \sin \theta$. $dx = 3 \cos \theta d\theta$ and $\sqrt{9 - x^2} = 3 \cos \theta$.

Moreover $x = 0 \implies \theta = \sin^{-1} \frac{x}{3} = \sin^{-1} 0 = 0$

and $x = \frac{3}{2} \implies \theta = \sin^{-1} \frac{x}{3} = \sin^{-1} \frac{1}{2} = \frac{\pi}{6}$. Therefore

$$\int_0^{\frac{3}{2}} \frac{dx}{\sqrt{9 - x^2}} = \int_0^{\frac{\pi}{6}} \frac{3 \cos \theta d\theta}{3 \cos \theta} = \int_0^{\frac{\pi}{6}} d\theta = \frac{\pi}{6}.$$

Or

$$\int_0^{\frac{3}{2}} \frac{dx}{\sqrt{9 - x^2}} = \left[\sin^{-1} \frac{x}{3} \right]_0^{\frac{3}{2}} = \frac{\pi}{6} - 0 = \frac{\pi}{6}.$$

EXAMPLE 2 Here we find an expression for the inverse hyperbolic sine function in terms of the natural logarithm. Following the same procedure as in Example 1, we find that

$$\begin{aligned}\int \frac{dx}{\sqrt{a^2 + x^2}} &= \int \sec \theta d\theta & x = a \tan \theta, dx = a \sec^2 \theta d\theta \\ &= \ln |\sec \theta + \tan \theta| + C \\ &= \ln \left| \frac{\sqrt{a^2 + x^2}}{a} + \frac{x}{a} \right| + C & \text{Fig. 8.2}\end{aligned}$$

From Table 7.11, $\sinh^{-1}(x/a)$ is also an antiderivative of $1/\sqrt{a^2 + x^2}$, so the two antiderivatives differ by a constant, giving

$$\sinh^{-1} \frac{x}{a} = \ln \left| \frac{\sqrt{a^2 + x^2}}{a} + \frac{x}{a} \right| + C.$$

Setting $x = 0$ in this last equation, we find $0 = \ln |1| + C$, so $C = 0$. Since $\sqrt{a^2 + x^2} > |x|$, we conclude that

$$\sinh^{-1} \frac{x}{a} = \ln \left(\frac{\sqrt{a^2 + x^2}}{a} + \frac{x}{a} \right)$$

EXAMPLE 3 Evaluate

$$\int \frac{x^2 dx}{\sqrt{9 - x^2}}.$$

Solution We set

$$x = 3 \sin \theta, \quad dx = 3 \cos \theta d\theta, \quad -\frac{\pi}{2} < \theta < \frac{\pi}{2}$$
$$9 - x^2 = 9 - 9 \sin^2 \theta = 9(1 - \sin^2 \theta) = 9 \cos^2 \theta.$$

Then

$$\begin{aligned}\int \frac{x^2 dx}{\sqrt{9 - x^2}} &= \int \frac{9 \sin^2 \theta \cdot 3 \cos \theta d\theta}{|3 \cos \theta|} \\&= 9 \int \sin^2 \theta d\theta && \cos \theta > 0 \text{ for } -\frac{\pi}{2} < \theta < \frac{\pi}{2} \\&= 9 \int \frac{1 - \cos 2\theta}{2} d\theta \\&= \frac{9}{2} \left(\theta - \frac{\sin 2\theta}{2} \right) + C \\&= \frac{9}{2} (\theta - \sin \theta \cos \theta) + C && \sin 2\theta = 2 \sin \theta \cos \theta \\&= \frac{9}{2} \left(\sin^{-1} \frac{x}{3} - \frac{x}{3} \cdot \frac{\sqrt{9 - x^2}}{3} \right) + C && \text{From Fig. 8.5} \\&= \frac{9}{2} \sin^{-1} \frac{x}{3} - \frac{x}{2} \sqrt{9 - x^2} + C.\end{aligned}$$

EXAMPLE 4 Evaluate

$$\int \frac{dx}{\sqrt{25x^2 - 4}}, \quad x > \frac{2}{5}.$$

Solution We first rewrite the radical as

$$\begin{aligned}\sqrt{25x^2 - 4} &= \sqrt{25\left(x^2 - \frac{4}{25}\right)} \\ &= 5\sqrt{x^2 - \left(\frac{2}{5}\right)^2} \quad \text{with } a = \frac{2}{5}\end{aligned}$$

to put the radicand in the form $x^2 - a^2$. We then substitute

$$x = \frac{2}{5} \sec \theta, \quad dx = \frac{2}{5} \sec \theta \tan \theta d\theta, \quad 0 < \theta < \frac{\pi}{2}.$$

We then get

$$x^2 - \left(\frac{2}{5}\right)^2 = \frac{4}{25} \sec^2 \theta - \frac{4}{25} = \frac{4}{25} (\sec^2 \theta - 1) = \frac{4}{25} \tan^2 \theta$$

and

$$\sqrt{x^2 - \left(\frac{2}{5}\right)^2} = \frac{2}{5} |\tan \theta| = \frac{2}{5} \tan \theta. \quad \begin{matrix} \tan \theta > 0 \text{ for} \\ 0 < \theta < \pi/2 \end{matrix}$$

With these substitutions, we have

$$\begin{aligned} \int \frac{dx}{\sqrt{25x^2 - 4}} &= \int \frac{dx}{5\sqrt{x^2 - (4/25)}} = \int \frac{(2/5) \sec \theta \tan \theta d\theta}{5 \cdot (2/5) \tan \theta} \\ &= \frac{1}{5} \int \sec \theta d\theta = \frac{1}{5} \ln |\sec \theta + \tan \theta| + C \\ &= \frac{1}{5} \ln \left| \frac{5x}{2} + \frac{\sqrt{25x^2 - 4}}{2} \right| + C. \end{aligned} \quad \text{From Fig. 8.6}$$

Method of Partial Fractions When $f(x)/g(x)$ Is Proper

- Let $x - r$ be a linear factor of $g(x)$. Suppose that $(x - r)^m$ is the highest power of $x - r$ that divides $g(x)$. Then, to this factor, assign the sum of the m partial fractions:

$$\frac{A_1}{(x - r)} + \frac{A_2}{(x - r)^2} + \cdots + \frac{A_m}{(x - r)^m}.$$

Do this for each distinct linear factor of $g(x)$.

- Let $x^2 + px + q$ be an irreducible quadratic factor of $g(x)$ so that $x^2 + px + q$ has no real roots. Suppose that $(x^2 + px + q)^n$ is the highest power of this factor that divides $g(x)$. Then, to this factor, assign the sum of the n partial fractions:

$$\frac{B_1x + C_1}{(x^2 + px + q)} + \frac{B_2x + C_2}{(x^2 + px + q)^2} + \cdots + \frac{B_nx + C_n}{(x^2 + px + q)^n}.$$

Do this for each distinct quadratic factor of $g(x)$.

- Set the original fraction $f(x)/g(x)$ equal to the sum of all these partial fractions. Clear the resulting equation of fractions and arrange the terms in decreasing powers of x .
- Equate the coefficients of corresponding powers of x and solve the resulting equations for the undetermined coefficients.

EXAMPLE 2 Use partial fractions to evaluate

$$\int \frac{6x + 7}{(x + 2)^2} dx.$$

Solution First we express the integrand as a sum of partial fractions with undetermined coefficients.

$$\frac{6x + 7}{(x + 2)^2} = \frac{A}{x + 2} + \frac{B}{(x + 2)^2}$$

Two terms because $(x + 2)$ is squared

$$\begin{aligned} 6x + 7 &= A(x + 2) + B \\ &= Ax + (2A + B) \end{aligned}$$

Multiply both sides by $(x + 2)^2$.

Equating coefficients of corresponding powers of x gives

$$A = 6 \quad \text{and} \quad 2A + B = 12 + B = 7, \quad \text{or} \quad A = 6 \quad \text{and} \quad B = -5.$$

Therefore,

$$\begin{aligned} \int \frac{6x + 7}{(x + 2)^2} dx &= \int \left(\frac{6}{x + 2} - \frac{5}{(x + 2)^2} \right) dx \\ &= 6 \int \frac{dx}{x + 2} - 5 \int (x + 2)^{-2} dx \\ &= 6 \ln |x + 2| + 5(x + 2)^{-1} + C. \end{aligned}$$

EXAMPLE 3

Use partial fractions to evaluate

$$\int \frac{2x^3 - 4x^2 - x - 3}{x^2 - 2x - 3} dx.$$

Solution First we divide the denominator into the numerator to get a polynomial plus a proper fraction.

$$\begin{array}{r} 2x \\ x^2 - 2x - 3 \overline{)2x^3 - 4x^2 - x - 3} \\ 2x^3 - 4x^2 - 6x - 3 \\ \hline 5x - 3 \end{array}$$

Then we write the improper fraction as a polynomial plus a proper fraction.

$$\frac{2x^3 - 4x^2 - x - 3}{x^2 - 2x - 3} = 2x + \frac{5x - 3}{x^2 - 2x - 3}$$

We found the partial fraction decomposition of the fraction on the right in the opening example, so

$$\begin{aligned} \int \frac{2x^3 - 4x^2 - x - 3}{x^2 - 2x - 3} dx &= \int 2x dx + \int \frac{5x - 3}{x^2 - 2x - 3} dx \\ &= \int 2x dx + \int \frac{2}{x + 1} dx + \int \frac{3}{x - 3} dx \\ &= x^2 + 2 \ln |x + 1| + 3 \ln |x - 3| + C. \end{aligned}$$

EXAMPLE 4 Use partial fractions to evaluate

$$\int \frac{-2x + 4}{(x^2 + 1)(x - 1)^2} dx.$$

Solution The denominator has an irreducible quadratic factor $x^2 + 1$ as well as a repeated linear factor $(x - 1)^2$, so we write

$$\frac{-2x + 4}{(x^2 + 1)(x - 1)^2} = \frac{Ax + B}{x^2 + 1} + \frac{C}{x - 1} + \frac{D}{(x - 1)^2}. \quad (2)$$

Clearing the equation of fractions gives

$$\begin{aligned}-2x + 4 &= (Ax + B)(x - 1)^2 + C(x - 1)(x^2 + 1) + D(x^2 + 1) \\&= (A + C)x^3 + (-2A + B - C + D)x^2 \\&\quad + (A - 2B + C)x + (B - C + D).\end{aligned}$$

Equating coefficients of like terms gives

$$\text{Coefficients of } x^3: \quad 0 = A + C$$

$$\text{Coefficients of } x^2: \quad 0 = -2A + B - C + D$$

$$\text{Coefficients of } x^1: \quad -2 = A - 2B + C$$

$$\text{Coefficients of } x^0: \quad 4 = B - C + D$$

We solve these equations simultaneously to find the values of A , B , C , and D :

$$-4 = -2A, \quad A = 2 \quad \text{Subtract fourth equation from second.}$$

$$C = -A = -2 \quad \text{From the first equation}$$

$$B = (A + C + 2)/2 = 1 \quad \text{From the third equation and } C = -A$$

$$D = 4 - B + C = 1. \quad \text{From the fourth equation}$$

We substitute these values into Equation (2), obtaining

$$\frac{-2x + 4}{(x^2 + 1)(x - 1)^2} = \frac{2x + 1}{x^2 + 1} - \frac{2}{x - 1} + \frac{1}{(x - 1)^2}.$$

Finally, using the expansion above we can integrate:

$$\begin{aligned}\int \frac{-2x + 4}{(x^2 + 1)(x - 1)^2} dx &= \int \left(\frac{2x + 1}{x^2 + 1} - \frac{2}{x - 1} + \frac{1}{(x - 1)^2} \right) dx \\&= \int \left(\frac{2x}{x^2 + 1} + \frac{1}{x^2 + 1} - \frac{2}{x - 1} + \frac{1}{(x - 1)^2} \right) dx \\&= \ln(x^2 + 1) + \tan^{-1} x - 2 \ln|x - 1| - \frac{1}{x - 1} + C.\end{aligned}$$

■

EXAMPLE 5 Use partial fractions to evaluate

$$\int \frac{dx}{x(x^2 + 1)^2}.$$

Solution The form of the partial fraction decomposition is

$$\frac{1}{x(x^2 + 1)^2} = \frac{A}{x} + \frac{Bx + C}{x^2 + 1} + \frac{Dx + E}{(x^2 + 1)^2}.$$

Multiplying by $x(x^2 + 1)^2$, we have

$$\begin{aligned} 1 &= A(x^2 + 1)^2 + (Bx + C)x(x^2 + 1) + (Dx + E)x \\ &= A(x^4 + 2x^2 + 1) + B(x^4 + x^2) + C(x^3 + x) + Dx^2 + Ex \\ &= (A + B)x^4 + Cx^3 + (2A + B + D)x^2 + (C + E)x + A. \end{aligned}$$

If we equate coefficients, we get the system

$$A + B = 0, \quad C = 0, \quad 2A + B + D = 0, \quad C + E = 0, \quad A = 1.$$

Solving this system gives $A = 1$, $B = -1$, $C = 0$, $D = -1$, and $E = 0$. Thus,

Solving this system gives $A = 1$, $B = -1$, $C = 0$, $D = -1$, and $E = 0$. Thus,

$$\begin{aligned}\int \frac{dx}{x(x^2 + 1)^2} &= \int \left[\frac{1}{x} + \frac{-x}{x^2 + 1} + \frac{-x}{(x^2 + 1)^2} \right] dx \\&= \int \frac{dx}{x} - \int \frac{x \, dx}{x^2 + 1} - \int \frac{x \, dx}{(x^2 + 1)^2} \\&= \int \frac{dx}{x} - \frac{1}{2} \int \frac{du}{u} - \frac{1}{2} \int \frac{du}{u^2} && u = x^2 + 1, \\&= \ln |x| - \frac{1}{2} \ln |u| + \frac{1}{2u} + K \\&= \ln |x| - \frac{1}{2} \ln (x^2 + 1) + \frac{1}{2(x^2 + 1)} + K \\&= \ln \frac{|x|}{\sqrt{x^2 + 1}} + \frac{1}{2(x^2 + 1)} + K.\end{aligned}$$

8.5 Integration of Rational Functions by Partial Fractions

Remark

When we have

$$\frac{f(x)}{(x - r_1)(x - r_2) \cdots (x - r_n)},$$

where r_1, r_2, \dots, r_n are all different, there is a quicker way to find partial fractions.

EXAMPLE 6 Find A , B , and C in the partial fraction expansion

$$\frac{x^2 + 1}{(x - 1)(x - 2)(x - 3)} = \frac{A}{x - 1} + \frac{B}{x - 2} + \frac{C}{x - 3}. \quad (3)$$

Solution If we multiply both sides of Equation (3) by $(x - 1)$ to get

$$\frac{x^2 + 1}{(x - 2)(x - 3)} = A + \frac{B(x - 1)}{x - 2} + \frac{C(x - 1)}{x - 3}$$

and set $x = 1$, the resulting equation gives the value of A :

$$\begin{aligned}\frac{(1)^2 + 1}{(1 - 2)(1 - 3)} &= A + 0 + 0, \\ A &= 1.\end{aligned}$$

In exactly the same way, we can multiply both sides by $(x - 2)$ and then substitute in $x = 2$. This gives

$$\frac{(2)^2 + 1}{(2 - 1)(2 - 3)} = B.$$

So $B = -5$. Finally, we multiply both sides by $(x - 3)$ and then substitute in $x = 3$, which yields

$$\frac{(3)^2 + 1}{(3 - 1)(3 - 2)} = C,$$

and $C = 5$.

8.5 Integration of Rational Functions by Partial Fractions

Example

Find $\int \frac{x+4}{x^3 + 3x^2 - 10x} dx$.

First we have

$$\begin{aligned}\frac{x+4}{x^3 + 3x^2 - 10x} &= \frac{x+4}{x(x-2)(x+5)} \\ &= \frac{A}{x} + \frac{B}{x-2} + \frac{C}{x+5}.\end{aligned}$$

- 1 multiply by x , then set $x = 0$;
- 2 multiply by $(x - 2)$, then set $x = 2$;
- 3 multiply by $(x + 5)$, then set $x = -5$.

8.5

$$\frac{x+4}{x(x-2)(x+5)} = \frac{A}{x} + \frac{B}{x-2} + \frac{C}{x+5}$$

- 1 multiply by x , then set $x = 0$;

$$\frac{x+4}{(x-2)(x+5)} = A + \frac{Bx}{x-2} + \frac{Cx}{x+5}$$

$$\frac{4}{(-2)(5)} = A + 0 + 0$$

$$-\frac{2}{5} = A$$

8.5

$$\frac{x+4}{x(x-2)(x+5)} = \frac{A}{x} + \frac{B}{x-2} + \frac{C}{x+5}$$

2 multiply by $(x - 2)$, then set $x = 2$;

$$\frac{x+4}{x(x+5)} = \frac{A(x-2)}{x} + B + \frac{C(x-2)}{x+5}$$

$$\frac{2+4}{(2)(7)} = 0 + B + 0$$

$$\frac{3}{7} = B$$

8.5

$$\frac{x+4}{x(x-2)(x+5)} = \frac{A}{x} + \frac{B}{x-2} + \frac{C}{x+5}$$

- 3 multiply by $(x + 5)$, then set $x = -5$.

$$\begin{aligned}\frac{x+4}{x(x-2)} &= \frac{A(x+5)}{x} + \frac{B(x+5)}{x-2} + C \\ \frac{-5+4}{(-5)(-7)} &= 0 + 0 + C \\ -\frac{1}{35} &= C\end{aligned}$$

8.5 Integration of Rational Functions by Partial Fractions

Therefore

$$\frac{x+4}{x(x-2)(x+5)} = \frac{-\frac{2}{5}}{x} + \frac{\frac{3}{7}}{x-2} + \frac{-\frac{1}{35}}{x+5}$$

8.5 Integration of Rational Functions by Partial Fractions

Therefore

$$\frac{x+4}{x(x-2)(x+5)} = \frac{-\frac{2}{5}}{x} + \frac{\frac{3}{7}}{x-2} + \frac{-\frac{1}{35}}{x+5}$$

and thus

$$\int \frac{x+4}{x(x-2)(x+5)} dx = -\frac{2}{5} \ln|x| + \frac{3}{7} \ln|x-2| - \frac{1}{35} \ln|x+5| + C.$$

8.5 Integration of Rational Functions by Partial Fractions

Remark

We can also use differentiation to find partial fractions.

EXAMPLE 7 Find A , B , and C in the equation

$$\frac{x - 1}{(x + 1)^3} = \frac{A}{x + 1} + \frac{B}{(x + 1)^2} + \frac{C}{(x + 1)^3}$$

by clearing fractions, differentiating the result, and substituting $x = -1$.

Solution We first clear fractions:

$$x - 1 = A(x + 1)^2 + B(x + 1) + C.$$

Substituting $x = -1$ shows $C = -2$. We then differentiate both sides with respect to x , obtaining

$$1 = 2A(x + 1) + B.$$

Substituting $x = -1$ shows $B = 1$. We differentiate again to get $0 = 2A$, which shows $A = 0$. Hence,

$$\frac{x - 1}{(x + 1)^3} = \frac{1}{(x + 1)^2} - \frac{2}{(x + 1)^3}.$$

8.5 Integration of Rational Functions by Partial Fractions

Remark

Sometimes we can just try putting in small numbers $x = 0$, $x = \pm 1$, $x = \pm 2$, etc. to find the coefficients A, B, C, \dots

EXAMPLE 8 Find A , B , and C in the expression

$$\frac{x^2 + 1}{(x - 1)(x - 2)(x - 3)} = \frac{A}{x - 1} + \frac{B}{x - 2} + \frac{C}{x - 3}$$

by assigning numerical values to x .

Solution Clear fractions to get

$$x^2 + 1 = A(x - 2)(x - 3) + B(x - 1)(x - 3) + C(x - 1)(x - 2).$$

Then let $x = 1, 2, 3$ successively to find A , B , and C :

$$x = 1: \quad (1)^2 + 1 = A(-1)(-2) + B(0) + C(0)$$

$$2 = 2A$$

$$A = 1$$

$$x = 2: \quad (2)^2 + 1 = A(0) + B(1)(-1) + C(0)$$

$$5 = -B$$

$$B = -5$$

$$x = 3: \quad (3)^2 + 1 = A(0) + B(0) + C(2)(1)$$

$$10 = 2C$$

$$C = 5.$$

Conclusion:

$$\frac{x^2 + 1}{(x - 1)(x - 2)(x - 3)} = \frac{1}{x - 1} - \frac{5}{x - 2} + \frac{5}{x - 3}.$$

Therefore the integral converges and the area has finite value 1.

EXAMPLE 2 Evaluate

$$\int_{-\infty}^{\infty} \frac{dx}{1 + x^2}.$$

Solution According to the definition (Part 3), we can choose $c = 0$ and write

$$\int_{-\infty}^{\infty} \frac{dx}{1 + x^2} = \int_{-\infty}^0 \frac{dx}{1 + x^2} + \int_0^{\infty} \frac{dx}{1 + x^2}.$$

Next we evaluate each improper integral on the right side of the equation above.

$$\begin{aligned}\int_{-\infty}^0 \frac{dx}{1 + x^2} &= \lim_{a \rightarrow -\infty} \int_a^0 \frac{dx}{1 + x^2} \\&= \lim_{a \rightarrow -\infty} \left[\tan^{-1} x \right]_a^0 \\&= \lim_{a \rightarrow -\infty} (\tan^{-1} 0 - \tan^{-1} a) = 0 - \left(-\frac{\pi}{2} \right) = \frac{\pi}{2}\end{aligned}$$

$$\begin{aligned}
 \int_0^\infty \frac{dx}{1+x^2} &= \lim_{b \rightarrow \infty} \int_0^b \frac{dx}{1+x^2} \\
 &= \lim_{b \rightarrow \infty} \left[\tan^{-1} x \right]_0^b \\
 &= \lim_{b \rightarrow \infty} (\tan^{-1} b - \tan^{-1} 0) = \frac{\pi}{2} - 0 = \frac{\pi}{2}
 \end{aligned}$$

Thus,

$$\int_{-\infty}^{\infty} \frac{dx}{1+x^2} = \frac{\pi}{2} + \frac{\pi}{2} = \pi.$$

Since $1/(1+x^2) > 0$, the improper integral can be interpreted as the (finite) area beneath the curve and above the x -axis (Figure 8.15). ■

$$\int_{-\infty}^{\infty} f(x) dx = \int_{-\infty}^c f(x) dx + \int_c^{\infty} f(x) dx.$$

This is not the same as $\lim_{b \rightarrow \infty} \int_{-b}^b f(x) dx !!!$

For example, $\int_0^{\infty} \frac{2x}{x^2 + 1} dx$ diverges

8.8 Improper Integrals

Remark

$$\int_{-\infty}^{\infty} f(x) dx = \int_{-\infty}^c f(x) dx + \int_c^{\infty} f(x) dx.$$

This is not the same as $\lim_{b \rightarrow \infty} \int_{-b}^b f(x) dx !!!$

For example, $\int_0^{\infty} \frac{2x}{x^2 + 1} dx$ diverges and hence $\int_{-\infty}^{\infty} \frac{2x}{x^2 + 1}$ diverges.

8.8 Improper Integrals

Remark

$$\int_{-\infty}^{\infty} f(x) dx = \int_{-\infty}^c f(x) dx + \int_c^{\infty} f(x) dx.$$

This is not the same as $\lim_{b \rightarrow \infty} \int_{-b}^b f(x) dx !!!$

For example, $\int_0^{\infty} \frac{2x}{x^2 + 1} dx$ diverges and hence $\int_{-\infty}^{\infty} \frac{2x}{x^2 + 1}$ diverges. However

$$\lim_{b \rightarrow \infty} \int_{-b}^b \frac{2x}{x^2 + 1} dx = 0.$$

(Left for you to prove.)

EXAMPLE 3 For what values of p does the integral $\int_1^\infty dx/x^p$ converge? When the integral does converge, what is its value?

Solution If $p \neq 1$,

$$\int_1^b \frac{dx}{x^p} = \left[\frac{x^{-p+1}}{-p+1} \right]_1^b = \frac{1}{1-p} (b^{-p+1} - 1) = \frac{1}{1-p} \left(\frac{1}{b^{p-1}} - 1 \right).$$

Thus,

$$\begin{aligned}\int_1^\infty \frac{dx}{x^p} &= \lim_{b \rightarrow \infty} \int_1^b \frac{dx}{x^p} \\ &= \lim_{b \rightarrow \infty} \left[\frac{1}{1-p} \left(\frac{1}{b^{p-1}} - 1 \right) \right] = \begin{cases} \frac{1}{p-1}, & p > 1 \\ \infty, & p < 1 \end{cases}\end{aligned}$$

because

$$\lim_{b \rightarrow \infty} \frac{1}{b^{p-1}} = \begin{cases} 0, & p > 1 \\ \infty, & p < 1. \end{cases}$$

Therefore, the integral converges to the value $1/(p-1)$ if $p > 1$ and it diverges if $p < 1$.

8.8 Improper Integrals

If $p = 1$, the integral also diverges:

$$\begin{aligned}
 \int_1^\infty \frac{dx}{x^p} &= \int_1^\infty \frac{dx}{x} \\
 &= \lim_{b \rightarrow \infty} \int_1^b \frac{dx}{x} \\
 &= \lim_{b \rightarrow \infty} \left[\ln x \right]_1^b \\
 &= \lim_{b \rightarrow \infty} (\ln b - \ln 1) = \infty.
 \end{aligned}$$

8.8 Improper Integrals

If $p = 1$, the integral also diverges:

$$\begin{aligned} \int_1^\infty \frac{dx}{x^p} &= \int_1^\infty \frac{dx}{x} \\ &= \lim_{b \rightarrow \infty} \int_1^b \frac{dx}{x} \\ &= \lim_{b \rightarrow \infty} \left[\ln x \right]_1^b \\ &= \lim_{b \rightarrow \infty} (\ln b - \ln 1) = \infty. \end{aligned}$$

Theorem

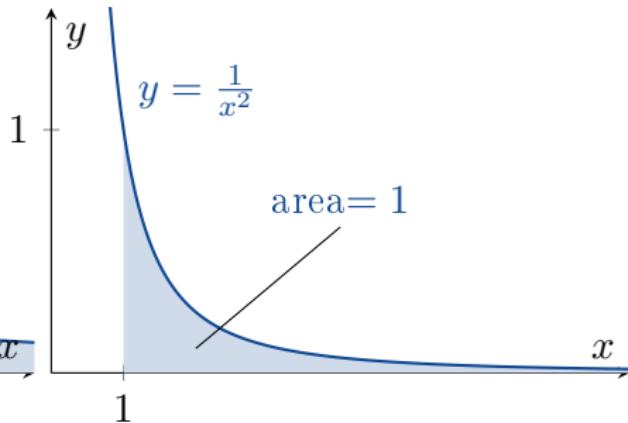

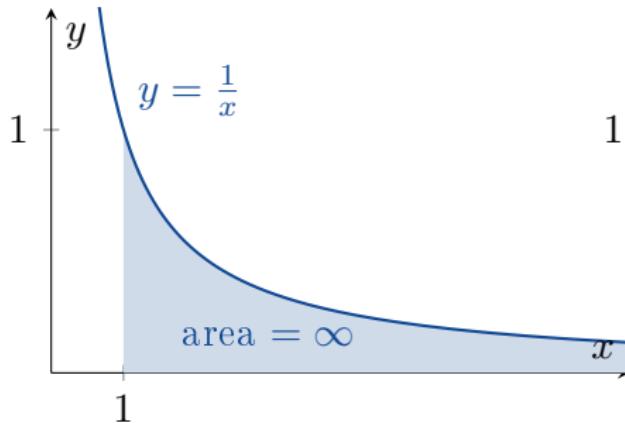

$$\int_1^\infty \frac{dx}{x^p} \quad \begin{cases} \text{converges if } p > 1, \\ \text{diverges if } p \leq 1. \end{cases}$$

DEFINITION Integrals of functions that become infinite at a point within the interval of integration are **improper integrals of Type II**.

1. If $f(x)$ is continuous on $(a, b]$ and discontinuous at a , then

$$\int_a^b f(x) dx = \lim_{c \rightarrow a^+} \int_c^b f(x) dx.$$

2. If $f(x)$ is continuous on $[a, b)$ and discontinuous at b , then

$$\int_a^b f(x) dx = \lim_{c \rightarrow b^-} \int_a^c f(x) dx.$$

3. If $f(x)$ is discontinuous at c , where $a < c < b$, and continuous on $[a, c) \cup (c, b]$, then

$$\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx.$$

In each case, if the limit exists and is finite, we say the improper integral **converges** and that the limit is the **value** of the improper integral. If the limit does not exist, the integral **diverges**.

EXAMPLE 4 Investigate the convergence of

$$\int_0^1 \frac{1}{1-x} dx.$$

Solution The integrand $f(x) = 1/(1-x)$ is continuous on $[0, 1)$ but is discontinuous at $x = 1$ and becomes infinite as $x \rightarrow 1^-$ (Figure 8.17). We evaluate the integral as

$$\begin{aligned}\lim_{b \rightarrow 1^-} \int_0^b \frac{1}{1-x} dx &= \lim_{b \rightarrow 1^-} [-\ln |1-x|]_0^b \\ &= \lim_{b \rightarrow 1^-} [-\ln(1-b) + 0] = \infty.\end{aligned}$$

The limit is infinite, so the integral diverges. ■

EXAMPLE 5 Evaluate

$$\int_0^3 \frac{dx}{(x - 1)^{2/3}}.$$

Solution The integrand has a vertical asymptote at $x = 1$ and is continuous on $[0, 1)$ and $(1, 3]$ (Figure 8.18). Thus, by Part 3 of the definition above,

$$\int_0^3 \frac{dx}{(x - 1)^{2/3}} = \int_0^1 \frac{dx}{(x - 1)^{2/3}} + \int_1^3 \frac{dx}{(x - 1)^{2/3}}.$$

Next, we evaluate each improper integral on the right-hand side of this equation.

$$\begin{aligned}\int_0^1 \frac{dx}{(x - 1)^{2/3}} &= \lim_{b \rightarrow 1^-} \int_0^b \frac{dx}{(x - 1)^{2/3}} \\&= \lim_{b \rightarrow 1^-} \left[3(x - 1)^{1/3} \right]_0^b \\&= \lim_{b \rightarrow 1^-} [3(b - 1)^{1/3} + 3] = 3\end{aligned}$$

$$\begin{aligned}
 \int_1^3 \frac{dx}{(x-1)^{2/3}} &= \lim_{c \rightarrow 1^+} \int_c^3 \frac{dx}{(x-1)^{2/3}} \\
 &= \lim_{c \rightarrow 1^+} \left[3(x-1)^{1/3} \right]_c^3 \\
 &= \lim_{c \rightarrow 1^+} [3(3-1)^{1/3} - 3(c-1)^{1/3}] = 3\sqrt[3]{2}
 \end{aligned}$$

We conclude that

$$\int_0^3 \frac{dx}{(x-1)^{2/3}} = 3 + 3\sqrt[3]{2}.$$

We can not calculate $\int_1^b e^{-x^2} dx$ because it is nonelementary.
But we can answer this example another way.

8.8 Improper Integrals

Since $e^{-x^2} > 0$, we know that $I(b) = \int_1^b e^{-x^2} dx$ is an increasing function of b .

8.8 Improper Integrals

Since $e^{-x^2} > 0$, we know that $I(b) = \int_1^b e^{-x^2} dx$ is an increasing function of b .

So either

- $\lim_{b \rightarrow \infty} \int_1^b e^{-x^2} dx = \infty$; or
- $\lim_{b \rightarrow \infty} \int_1^b e^{-x^2} dx$ is a finite number.

8.8 Improper Integrals

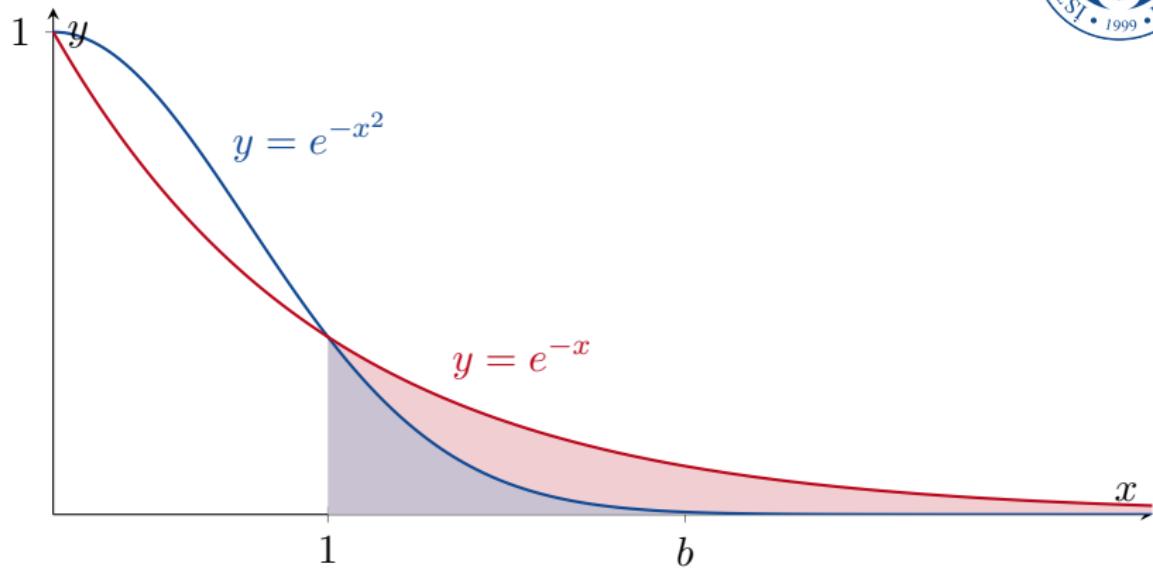

Since $e^{-x^2} > 0$, we know that $I(b) = \int_1^b e^{-x^2} dx$ is an increasing function of b .

So either

- $\lim_{b \rightarrow \infty} \int_1^b e^{-x^2} dx = \infty$; or
- $\lim_{b \rightarrow \infty} \int_1^b e^{-x^2} dx$ is a finite number.

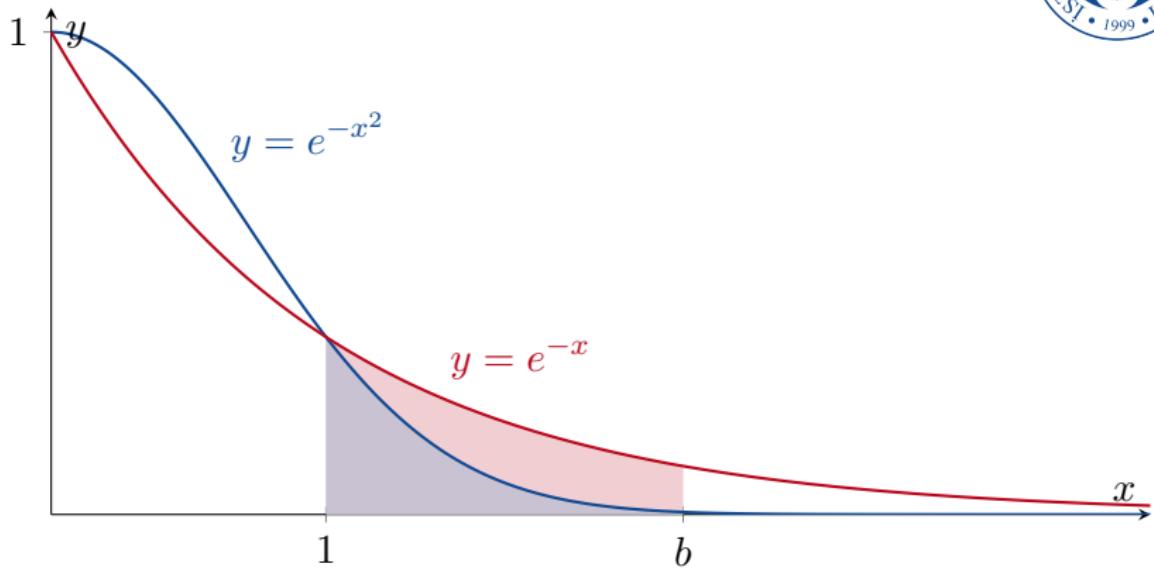

I am going to prove to you that $\lim_{b \rightarrow \infty} \int_1^b e^{-x^2} dx$ is finite.

8.8 Improper Integrals

Note that $e^{-x^2} \leq e^{-x}$ for all $x \geq 1$.

8.8 Improper Integrals

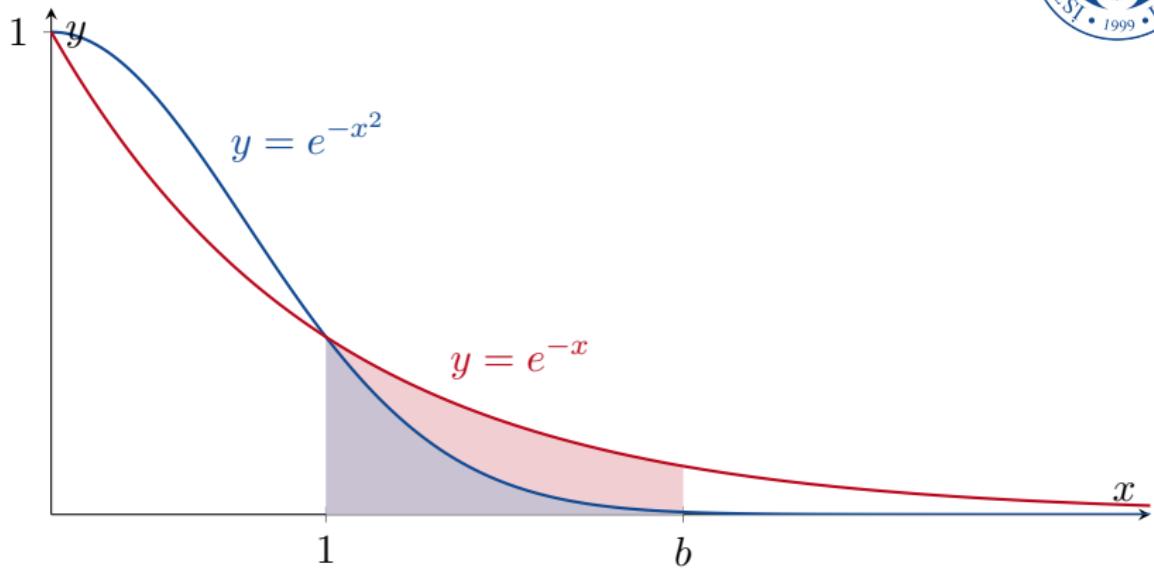

Note that $e^{-x^2} \leq e^{-x}$ for all $x \geq 1$. So

$$\int_1^b e^{-x^2} dx \leq \int_1^b e^{-x} dx$$

for any $b > 1$.

8.8 Improper Integrals

Note that $e^{-x^2} \leq e^{-x}$ for all $x \geq 1$. So

$$\int_1^b e^{-x^2} dx \leq \int_1^b e^{-x} dx = -e^{-b} + e^{-1} < e^{-1} \approx 0.36788$$

for any $b > 1$.

8.8 Improper Integrals

Therefore

$$\int_1^{\infty} e^{-x^2} dx = \lim_{b \rightarrow \infty} \int_1^b e^{-x^2} dx$$

converges to a finite value.

EXAMPLE 7

These examples illustrate how we use Theorem 2.

(a) $\int_1^\infty \frac{\sin^2 x}{x^2} dx$ converges because

$$0 \leq \frac{\sin^2 x}{x^2} \leq \frac{1}{x^2} \quad \text{on } [1, \infty) \quad \text{and} \quad \int_1^\infty \frac{1}{x^2} dx \quad \text{converges.}$$

Example 3

(b) $\int_1^\infty \frac{1}{\sqrt{x^2 - 0.1}} dx$ diverges because

$$\frac{1}{\sqrt{x^2 - 0.1}} \geq \frac{1}{x} \quad \text{on } [1, \infty) \quad \text{and} \quad \int_1^\infty \frac{1}{x} dx \quad \text{diverges.}$$

Example 3

(c) $\int_0^{\pi/2} \frac{\cos x}{\sqrt{x}} dx$ converges because

$$0 \leq \frac{\cos x}{\sqrt{x}} \leq \frac{1}{\sqrt{x}} \quad \text{on} \quad \left[0, \frac{\pi}{2}\right], \quad 0 \leq \cos x \leq 1 \text{ on } \left[0, \frac{\pi}{2}\right]$$

and

$$\begin{aligned} \int_0^{\pi/2} \frac{dx}{\sqrt{x}} &= \lim_{a \rightarrow 0^+} \int_a^{\pi/2} \frac{dx}{\sqrt{x}} \\ &= \lim_{a \rightarrow 0^+} \sqrt{4x} \Big|_a^{\pi/2} \quad 2\sqrt{x} = \sqrt{4x} \\ &= \lim_{a \rightarrow 0^+} (\sqrt{2\pi} - \sqrt{4a}) = \sqrt{2\pi} \quad \text{converges.} \end{aligned}$$

Then

$$\int_a^{\infty} f(x) dx \quad \text{and} \quad \int_a^{\infty} g(x) dx$$

both converge or both diverge.

8.8 Improper Integrals

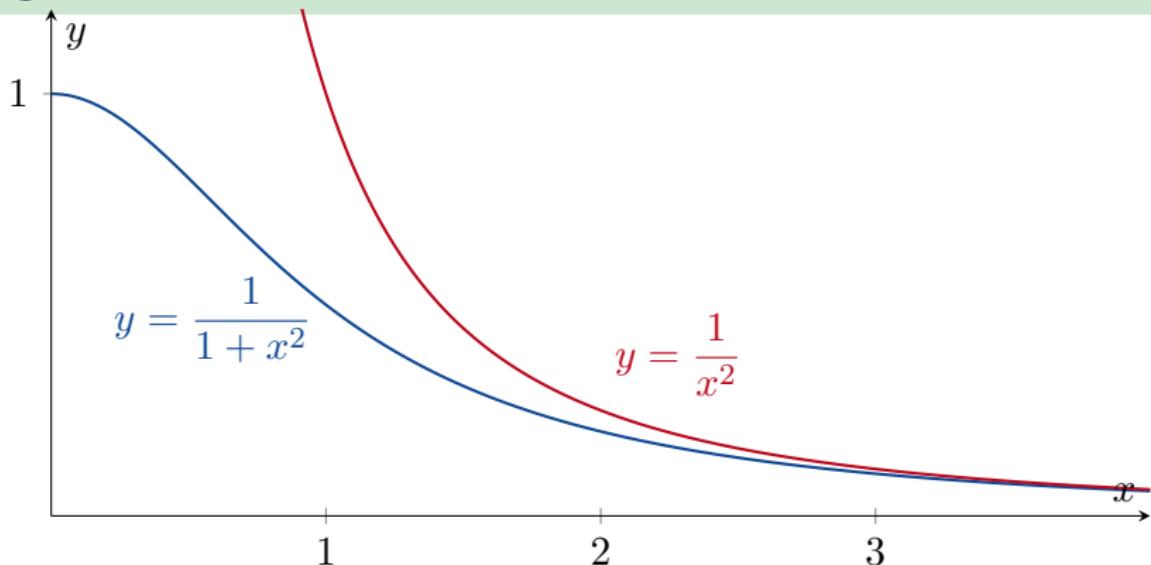

Example

Show that $\int_1^\infty \frac{dx}{1+x^2}$ diverges, by comparing it with $\int_1^\infty \frac{1}{x^2} dx$.

8.8 Improper Integrals

Example

Show that $\int_1^\infty \frac{dx}{1+x^2}$ diverges, by comparing it with $\int_1^\infty \frac{1}{x^2} dx$.

Solution The functions $f(x) = 1/x^2$ and $g(x) = 1/(1 + x^2)$ are positive and continuous on $[1, \infty)$. Also,

$$\begin{aligned}\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} &= \lim_{x \rightarrow \infty} \frac{1/x^2}{1/(1 + x^2)} = \lim_{x \rightarrow \infty} \frac{1 + x^2}{x^2} \\&= \lim_{x \rightarrow \infty} \left(\frac{1}{x^2} + 1 \right) = 0 + 1 = 1,\end{aligned}$$

which is a positive finite limit (Figure 8.20). Therefore, $\int_1^\infty \frac{dx}{1 + x^2}$ converges because $\int_1^\infty \frac{dx}{x^2}$ converges.

The integrals converge to different values, however:

$$\int_1^\infty \frac{dx}{x^2} = \frac{1}{2 - 1} = 1 \quad \text{Example 3}$$

and

$$\int_1^\infty \frac{dx}{1 + x^2} = \lim_{b \rightarrow \infty} \int_1^b \frac{dx}{1 + x^2} = \lim_{b \rightarrow \infty} [\tan^{-1} b - \tan^{-1} 1] = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}. \quad \blacksquare$$

EXAMPLE 9 Investigate the convergence of $\int_1^\infty \frac{1 - e^{-x}}{x} dx$.

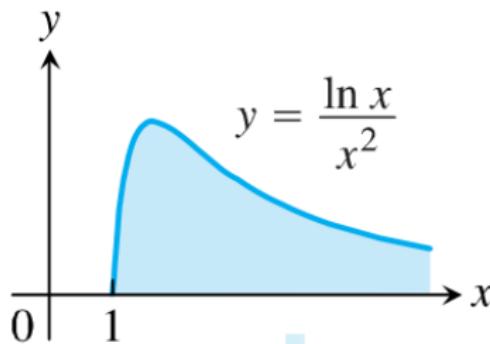

Solution The integrand suggests a comparison of $f(x) = (1 - e^{-x})/x$ with $g(x) = 1/x$. However, we cannot use the Direct Comparison Test because $f(x) \leq g(x)$ and the integral of $g(x)$ diverges. On the other hand, using the Limit Comparison Test we find that

$$\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = \lim_{x \rightarrow \infty} \left(\frac{1 - e^{-x}}{x} \right) \left(\frac{x}{1} \right) = \lim_{x \rightarrow \infty} (1 - e^{-x}) = 1,$$

which is a positive finite limit. Therefore, $\int_1^\infty \frac{1 - e^{-x}}{x} dx$ diverges because $\int_1^\infty \frac{dx}{x}$ diverges. Approximations to the improper integral are given in Table 8.5. Note that the values do not appear to approach any fixed limiting value as $b \rightarrow \infty$. ■

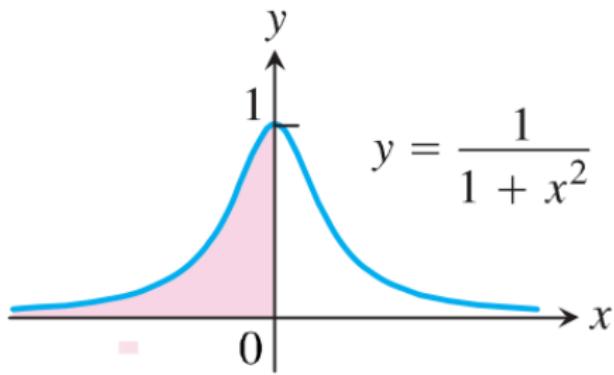

Upper limit

$$\int_1^{\infty} \frac{\ln x}{x^2} dx = \lim_{b \rightarrow \infty} \int_1^b \frac{\ln x}{x^2} dx$$

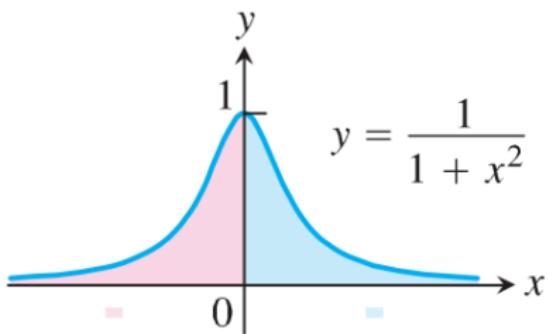

Lower limit

$$\int_{-\infty}^0 \frac{dx}{1+x^2} = \lim_{a \rightarrow -\infty} \int_a^0 \frac{dx}{1+x^2}$$

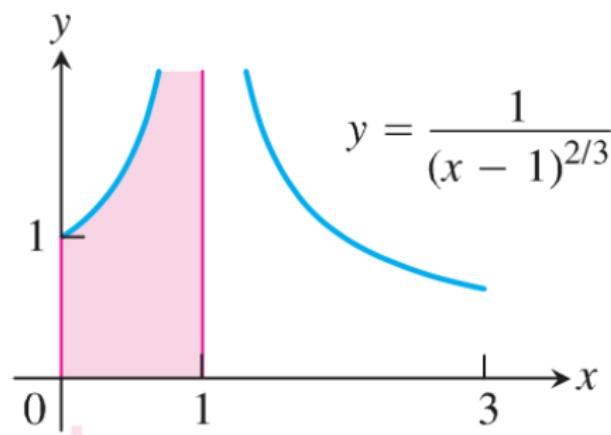

Both limits

$$\int_{-\infty}^{\infty} \frac{dx}{1+x^2} = \lim_{b \rightarrow -\infty} \int_b^0 \frac{dx}{1+x^2} + \lim_{c \rightarrow \infty} \int_0^c \frac{dx}{1+x^2}$$

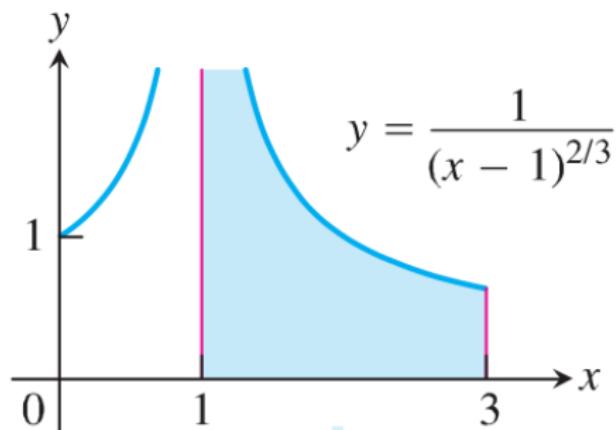

Upper endpoint

$$\int_0^1 \frac{dx}{(x - 1)^{2/3}} = \lim_{b \rightarrow 1^-} \int_0^b \frac{dx}{(x - 1)^{2/3}}$$

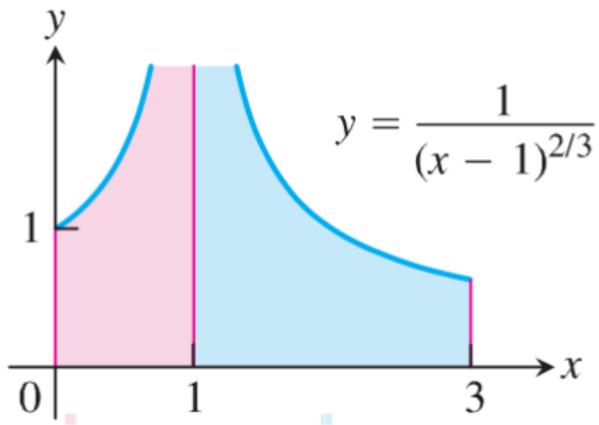

Lower endpoint

$$\int_1^3 \frac{dx}{(x - 1)^{2/3}} = \lim_{d \rightarrow 1^+} \int_d^3 \frac{dx}{(x - 1)^{2/3}}$$

Interior point

$$\int_0^3 \frac{dx}{(x - 1)^{2/3}} = \int_0^1 \frac{dx}{(x - 1)^{2/3}} + \int_1^3 \frac{dx}{(x - 1)^{2/3}}$$
