

# Lecture 11

- 5.5 Fundamental Matrices
- 5.6 Repeated Eigenvalues

Now consider

$$\mathbf{x}' = P(t)\mathbf{x}$$

where P is an  $n \times n$  matrix.

Now consider

$$\mathbf{x}' = P(t)\mathbf{x}$$

where P is an  $n \times n$  matrix. Suppose that  $\mathbf{x}^{(1)}, \mathbf{x}^{(2)}, \ldots, \mathbf{x}^{(n)}$  are linearly independent solutions to this ODE. In other words, suppose that  $\mathbf{x}^{(1)}, \mathbf{x}^{(2)}, \ldots, \mathbf{x}^{(n)}$  form a fundamental set of solutions to this ODE.

#### Definition

The matrix

$$\Psi(t) = \begin{bmatrix} \mathbf{x}^{(1)} & \mathbf{x}^{(2)} & \dots & \mathbf{x}^{(n)} \end{bmatrix} = \begin{bmatrix} x_1^{(1)}(t) & x_1^{(2)}(t) & \dots & x_1^{(n)}(t) \\ x_2^{(1)}(t) & x_2^{(2)}(t) & \dots & x_2^{(n)}(t) \\ \vdots & \vdots & & \vdots \\ x_n^{(1)}(t) & x_n^{(2)}(t) & \dots & x_n^{(n)}(t) \end{bmatrix}$$

is called a fundamental matrix of  $\mathbf{x}' = P(t)\mathbf{x}$ .

#### Example

Find a fundamental matrix for

$$\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}.$$

#### Example

Find a fundamental matrix for

$$\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}.$$

Recall that

$$\mathbf{x}^{(1)}(t) = \begin{bmatrix} 1 \\ 2 \end{bmatrix} e^{3t}$$
 and  $\mathbf{x}^{(2)}(t) = \begin{bmatrix} 1 \\ -2 \end{bmatrix} e^{-t}$ 

form a fundamental set of solutions to this ODE.

#### Example

Find a fundamental matrix for

$$\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}.$$

Recall that

$$\mathbf{x}^{(1)}(t) = \begin{bmatrix} 1 \\ 2 \end{bmatrix} e^{3t}$$
 and  $\mathbf{x}^{(2)}(t) = \begin{bmatrix} 1 \\ -2 \end{bmatrix} e^{-t}$ 

form a fundamental set of solutions to this ODE. Therefore

$$\Psi(t) = \begin{bmatrix} e^{3t} & e^{-t} \\ 2e^{3t} & -2e^{-t} \end{bmatrix}$$

is a fundamental matrix of this ODE.

Now, the general solution to

$$\mathbf{x}' = A\mathbf{x}$$

is

$$\mathbf{x}(t) = c_1 \mathbf{x}^{(1)}(t) + c_2 \mathbf{x}^{(2)}(t) + \dots + c_n \mathbf{x}^{(n)}(t)$$

Now, the general solution to

$$\mathbf{x}' = A\mathbf{x}$$

is

$$\mathbf{x}(t) = c_1 \mathbf{x}^{(1)}(t) + c_2 \mathbf{x}^{(2)}(t) + \dots + c_n \mathbf{x}^{(n)}(t) = \Psi(t)\mathbf{c}$$

where

$$\mathbf{c} = \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix} \in \mathbb{R}^n.$$

Now, the general solution to

$$\mathbf{x}' = A\mathbf{x}$$

is

$$\mathbf{x}(t) = c_1 \mathbf{x}^{(1)}(t) + c_2 \mathbf{x}^{(2)}(t) + \dots + c_n \mathbf{x}^{(n)}(t) = \Psi(t)\mathbf{c}$$

where

$$\mathbf{c} = \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix} \in \mathbb{R}^n.$$

If we have an initial condition  $\mathbf{x}(t_0) = \mathbf{x}^0$ , then

$$\Psi(t_0)\mathbf{c} = \mathbf{x}^0.$$

$$\mathbf{x}(t) = \Psi(t)\mathbf{c} \qquad \qquad \Psi(t_0)\mathbf{c} = \mathbf{x}^0$$

But

$$\mathbf{x}^{(1)}, \dots, \mathbf{x}^{(n)}$$
 are linearly independent

$$\mathbf{x}(t) = \Psi(t)\mathbf{c}$$
  $\Psi(t_0)\mathbf{c} = \mathbf{x}^0$ 

But

$$\mathbf{x}^{(1)}, \dots, \mathbf{x}^{(n)}$$
 are linearly  $\Longrightarrow \Psi(t)$  is invertible independent

$$\mathbf{x}(t) = \Psi(t)\mathbf{c} \qquad \qquad \Psi(t_0)\mathbf{c} = \mathbf{x}^0$$

But

$$\mathbf{x}^{(1)}, \dots, \mathbf{x}^{(n)}$$
 are linearly  $\Longrightarrow \Psi(t)$  is invertible independent  $\Longrightarrow \mathbf{c} = \Psi^{-1}(t_0)\mathbf{x}^0.$ 

$$\mathbf{x}(t) = \Psi(t)\mathbf{c}$$
  $\Psi(t_0)\mathbf{c} = \mathbf{x}^0$ 

But

$$\mathbf{x}^{(1)}, \dots, \mathbf{x}^{(n)}$$
 are linearly  $\Longrightarrow \Psi(t)$  is invertible independent  $\Longrightarrow \mathbf{c} = \Psi^{-1}(t_0)\mathbf{x}^0.$ 

Therefore the solution to the IVP

$$\begin{cases} \mathbf{x}' = A\mathbf{x} \\ \mathbf{x}(t_0) = \mathbf{x}^0 \end{cases}$$

is

$$\mathbf{x}(t) = \Psi(t)\Psi^{-1}(t_0)\mathbf{x}^0.$$

#### Theorem

Suppose that  $\Psi(t)$  is a fundamental matrix for  $\mathbf{x}' = P(t)\mathbf{x}$ . Then  $\Psi(t)$  solves the differential equation  $\Psi' = P(t)\Psi$ .

(You prove)

#### Remark

It is possible to find a special fundamental matrix,  $\Phi(t)$ , which satisfies

$$\Phi(t_0) = \begin{bmatrix} 1 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \dots & 1 \end{bmatrix} = I.$$

#### Remark

It is possible to find a special fundamental matrix,  $\Phi(t)$ , which satisfies

$$\Phi(t_0) = \begin{bmatrix} 1 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \dots & 1 \end{bmatrix} = I.$$

We will use  $\Phi$  for this special fundamental matrix, and  $\Psi$  for any fundamental matrix.

#### Example

Consider

$$\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}.$$

Find the special fundamental matrix which satisfies  $\Phi(0) = I$ .

To find the matrix  $\Phi$  which satisfies

$$\Phi(0) = \begin{bmatrix} 1 & \mathbf{0} \\ 0 & \mathbf{1} \end{bmatrix},$$

we must solve two IVPs:

$$\begin{cases} \mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x} \\ \mathbf{x}(0) = \begin{bmatrix} 1 \\ 0 \end{bmatrix} \end{cases} \text{ and } \begin{cases} \mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x} \\ \mathbf{x}(0) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}.$$

The general solution to the ODE is

$$\mathbf{x}(t) = c_1 \begin{bmatrix} 1 \\ 2 \end{bmatrix} e^{3t} + c_2 \begin{bmatrix} 1 \\ -2 \end{bmatrix} e^{-t}.$$

We calculate that

$$\begin{bmatrix} 1 \\ 0 \end{bmatrix} = \mathbf{x}(0) = c_1 \begin{bmatrix} 1 \\ 2 \end{bmatrix} + c_2 \begin{bmatrix} 1 \\ -2 \end{bmatrix} \implies \begin{aligned} c_1 &= \frac{1}{2} \\ c_2 &= \frac{1}{2} \end{aligned}$$
$$\implies \mathbf{x}(t) = \begin{bmatrix} \frac{1}{2}e^{3t} + \frac{1}{2}e^{-t} \\ e^{3t} - e^{-t} \end{bmatrix}$$

We calculate that

$$\begin{bmatrix} 1 \\ 0 \end{bmatrix} = \mathbf{x}(0) = c_1 \begin{bmatrix} 1 \\ 2 \end{bmatrix} + c_2 \begin{bmatrix} 1 \\ -2 \end{bmatrix} \implies \begin{aligned} c_1 &= \frac{1}{2} \\ c_2 &= \frac{1}{2} \end{aligned}$$
$$\implies \mathbf{x}(t) = \begin{bmatrix} \frac{1}{2}e^{3t} + \frac{1}{2}e^{-t} \\ e^{3t} - e^{-t} \end{bmatrix}$$

and

$$\begin{bmatrix} 0 \\ 1 \end{bmatrix} = \mathbf{x}(0) = c_1 \begin{bmatrix} 1 \\ 2 \end{bmatrix} + c_2 \begin{bmatrix} 1 \\ -2 \end{bmatrix} \implies \begin{aligned} c_1 &= \frac{1}{4} \\ c_2 &= -\frac{1}{4} \end{aligned}$$
$$\implies \mathbf{x}(t) = \begin{bmatrix} \frac{1}{4}e^{3t} - \frac{1}{4}e^{-t} \\ \frac{1}{2}e^{3t} + \frac{1}{2}e^{-t} \end{bmatrix}.$$

Therefore the special fundamental matrix is

$$\Phi(t) = \begin{bmatrix} \frac{1}{2}e^{3t} + \frac{1}{2}e^{-t} & \frac{1}{4}e^{3t} - \frac{1}{4}e^{-t} \\ e^{3t} - e^{-t} & \frac{1}{2}e^{3t} + \frac{1}{2}e^{-t} \end{bmatrix}.$$

# What is $e^{At}$ ?

Recall that the solution to

$$\begin{cases} x' = ax \ (a \in \mathbb{R}) \\ x(0) = x_0 \end{cases}$$

is

$$x(t) = x_0 e^{at} = x_0 \exp(at)$$

and recall that

$$\exp(at) = 1 + \sum_{n=1}^{\infty} \frac{a^n t^n}{n!}.$$

Now consider

$$\begin{cases} \mathbf{x}' = A\mathbf{x} \\ \mathbf{x}(0) = \mathbf{x}^0 \end{cases}$$

for  $A \in \mathbb{R}^{n \times n}$ .

Now consider

$$\begin{cases} \mathbf{x}' = A\mathbf{x} \\ \mathbf{x}(0) = \mathbf{x}^0 \end{cases}$$

for  $A \in \mathbb{R}^{n \times n}$ .

#### Definition

$$\exp(At) = I + \sum_{n=1}^{\infty} \frac{A^n t^n}{n!} = I + At + \frac{A^2 t^2}{2!} + \frac{A^3 t^3}{3!} + \dots$$

$$\frac{d}{dt}\exp(At) = \frac{d}{dt}\left(I + \sum_{n=1}^{\infty} \frac{A^n t^n}{n!}\right) =$$

$$= =$$

$$=$$

$$\frac{d}{dt}\exp(At) = \frac{d}{dt}\left(I + \sum_{n=1}^{\infty} \frac{A^n t^n}{n!}\right) = 0 + \sum_{n=1}^{\infty} \frac{d}{dt}\left(\frac{A^n t^n}{n!}\right)$$

$$= = =$$

$$=$$

Note that

$$\frac{d}{dt}\exp(At) = \frac{d}{dt}\left(I + \sum_{n=1}^{\infty} \frac{A^n t^n}{n!}\right) = 0 + \sum_{n=1}^{\infty} \frac{d}{dt}\left(\frac{A^n t^n}{n!}\right)$$
$$= \sum_{n=1}^{\infty} \frac{A^n t^{n-1}}{(n-1)!} =$$
$$=$$

17 of 56

$$\frac{d}{dt}\exp(At) = \frac{d}{dt}\left(I + \sum_{n=1}^{\infty} \frac{A^n t^n}{n!}\right) = 0 + \sum_{n=1}^{\infty} \frac{d}{dt}\left(\frac{A^n t^n}{n!}\right)$$

$$= \sum_{n=1}^{\infty} \frac{A^n t^{n-1}}{(n-1)!} = A + \sum_{n=2}^{\infty} \frac{A^n t^{n-1}}{(n-1)!}$$

$$=$$

$$\frac{d}{dt} \exp(At) = \frac{d}{dt} \left( I + \sum_{n=1}^{\infty} \frac{A^n t^n}{n!} \right) = 0 + \sum_{n=1}^{\infty} \frac{d}{dt} \left( \frac{A^n t^n}{n!} \right)$$

$$= \sum_{n=1}^{\infty} \frac{A^n t^{n-1}}{(n-1)!} = A + \sum_{n=2}^{\infty} \frac{A^n t^{n-1}}{(n-1)!}$$

$$= A + \sum_{k=1}^{\infty} \frac{A^{k+1} t^k}{(k)!} \qquad (k = n - 1)$$

$$= \sum_{n=1}^{\infty} \frac{A^{k+1} t^k}{(k)!} = 0$$

$$\frac{d}{dt} \exp(At) = \frac{d}{dt} \left( I + \sum_{n=1}^{\infty} \frac{A^n t^n}{n!} \right) = 0 + \sum_{n=1}^{\infty} \frac{d}{dt} \left( \frac{A^n t^n}{n!} \right)$$

$$= \sum_{n=1}^{\infty} \frac{A^n t^{n-1}}{(n-1)!} = A + \sum_{n=2}^{\infty} \frac{A^n t^{n-1}}{(n-1)!}$$

$$= A + \sum_{k=1}^{\infty} \frac{A^{k+1} t^k}{(k)!} \qquad (k = n-1)$$

$$= A \left( I + \sum_{k=1}^{\infty} \frac{A^k t^k}{(k)!} \right) =$$

$$\frac{d}{dt} \exp(At) = \frac{d}{dt} \left( I + \sum_{n=1}^{\infty} \frac{A^n t^n}{n!} \right) = 0 + \sum_{n=1}^{\infty} \frac{d}{dt} \left( \frac{A^n t^n}{n!} \right)$$

$$= \sum_{n=1}^{\infty} \frac{A^n t^{n-1}}{(n-1)!} = A + \sum_{n=2}^{\infty} \frac{A^n t^{n-1}}{(n-1)!}$$

$$= A + \sum_{k=1}^{\infty} \frac{A^{k+1} t^k}{(k)!} \qquad (k = n-1)$$

$$= A \left( I + \sum_{k=1}^{\infty} \frac{A^k t^k}{(k)!} \right) = A \exp(At).$$

This means that  $\exp(At)$  solves

$$\begin{cases} \left(\exp(At)\right)' = A\exp(At) \\ \exp(At)|_{t=0} = I. \end{cases}$$

This means that  $\exp(At)$  solves

$$\begin{cases} \left(\exp(At)\right)' = A\exp(At) \\ \exp(At)|_{t=0} = I. \end{cases}$$

But remember that  $\Phi$  solves

$$\begin{cases} \Phi' = A\phi \\ \Phi(0) = I. \end{cases}$$

This means that  $\exp(At)$  solves

$$\begin{cases} \left(\exp(At)\right)' = A\exp(At) \\ \exp(At)|_{t=0} = I. \end{cases}$$

But remember that  $\Phi$  solves

$$\begin{cases} \Phi' = A\phi \\ \Phi(0) = I. \end{cases}$$

Therefore

$$\Phi(t) = \exp(At).$$

#### Example

Let 
$$A = \begin{bmatrix} 8 & -1 \\ 6 & 1 \end{bmatrix}$$
. Find  $\exp(At)$ .

#### Example

Let 
$$A = \begin{bmatrix} 8 & -1 \\ 6 & 1 \end{bmatrix}$$
. Find  $\exp(At)$ .

We have previously found that the general solution to  $\mathbf{x}' = A\mathbf{x}$  is

$$\mathbf{x}(t) = c_1 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{7t} + c_2 \begin{bmatrix} 1 \\ 6 \end{bmatrix} e^{2t}.$$

To satisfy 
$$\mathbf{x}(0) = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$
 we require  $c_1 = \frac{6}{5}$  and  $c_2 = -\frac{1}{5}$ . Hence

$$\mathbf{x}(t) = \frac{6}{5} \begin{bmatrix} 1\\1 \end{bmatrix} e^{7t} - \frac{1}{5} \begin{bmatrix} 1\\6 \end{bmatrix} e^{2t} = \begin{bmatrix} \frac{6}{5}e^{7t} - \frac{1}{5}e^{2t}\\ \frac{6}{5}e^{7t} - \frac{6}{5}e^{2t} \end{bmatrix}.$$

To satisfy 
$$\mathbf{x}(0) = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$
 we require  $c_1 = \frac{6}{5}$  and  $c_2 = -\frac{1}{5}$ . Hence

$$\mathbf{x}(t) = \frac{6}{5} \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{7t} - \frac{1}{5} \begin{bmatrix} 1 \\ 6 \end{bmatrix} e^{2t} = \begin{bmatrix} \frac{6}{5}e^{7t} - \frac{1}{5}e^{2t} \\ \frac{6}{5}e^{7t} - \frac{6}{5}e^{2t} \end{bmatrix}.$$

To satisfy 
$$\mathbf{x}(0) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$
 we require  $c_1 = -\frac{1}{5}$  and  $c_2 = \frac{1}{5}$ . Hence

$$\mathbf{x}(t) = -\frac{1}{5} \begin{bmatrix} 1\\1 \end{bmatrix} e^{7t} + \frac{1}{5} \begin{bmatrix} 1\\6 \end{bmatrix} e^{2t} = \begin{bmatrix} -\frac{1}{5}e^{7t} + \frac{1}{5}e^{2t}\\ -\frac{1}{5}e^{7t} + \frac{6}{5}e^{2t} \end{bmatrix}.$$

Therefore the answer is

$$\exp(At) = \Phi(t) = \begin{bmatrix} \frac{6}{5}e^{7t} - \frac{1}{5}e^{2t} & -\frac{1}{5}e^{7t} + \frac{1}{5}e^{2t} \\ \frac{6}{5}e^{7t} - \frac{6}{5}e^{2t} & -\frac{1}{5}e^{7t} + \frac{6}{5}e^{2t} \end{bmatrix}.$$

# Diagonalisable Matrices

If

$$D = \begin{bmatrix} r_1 & 0 & 0 & \dots & 0 \\ 0 & r_2 & 0 & \dots & 0 \\ 0 & 0 & r_3 & \dots & 0 \\ \vdots & \vdots & \vdots & & \vdots \\ 0 & 0 & 0 & \dots & r_n \end{bmatrix}$$

is a diagonal matrix, then it is easy to calculate  $\exp(Dt)$ . We simply have

$$\exp(Dt) = \begin{bmatrix} e^{r_1t} & 0 & 0 & \dots & 0 \\ 0 & e^{r_2t} & 0 & \dots & 0 \\ 0 & 0 & e^{r_3t} & \dots & 0 \\ \vdots & \vdots & \vdots & & \vdots \\ 0 & 0 & 0 & \dots & e^{r_nt} \end{bmatrix}.$$

Now consider

$$\mathbf{x}' = A\mathbf{x}$$

for  $A \in \mathbb{R}^{n \times n}$ .

Now consider

$$\mathbf{x}' = A\mathbf{x}$$

for  $A \in \mathbb{R}^{n \times n}$ . Recall how we diagonalise a matrix: If  $\boldsymbol{\xi}^{(1)}$ ,  $\boldsymbol{\xi}^{(2)}$ , ...,  $\boldsymbol{\xi}^{(n)}$  are the eigenvectors of A, we let

$$T = egin{bmatrix} oldsymbol{\xi}^{(1)} & oldsymbol{\xi}^{(2)} & \dots & oldsymbol{\xi}^{(n)} \end{bmatrix}.$$

Now consider

$$\mathbf{x}' = A\mathbf{x}$$

for  $A \in \mathbb{R}^{n \times n}$ . Recall how we diagonalise a matrix: If  $\boldsymbol{\xi}^{(1)}$ ,  $\boldsymbol{\xi}^{(2)}$ , ...,  $\boldsymbol{\xi}^{(n)}$  are the eigenvectors of A, we let

$$T = \begin{bmatrix} \boldsymbol{\xi}^{(1)} & \boldsymbol{\xi}^{(2)} & \dots & \boldsymbol{\xi}^{(n)} \end{bmatrix}.$$

Then

$$\det(T) \neq 0 \implies \begin{array}{c} T^{-1} \\ \text{exists} \end{array}$$

Now consider

$$\mathbf{x}' = A\mathbf{x}$$

for  $A \in \mathbb{R}^{n \times n}$ . Recall how we diagonalise a matrix: If  $\boldsymbol{\xi}^{(1)}$ ,  $\boldsymbol{\xi}^{(2)}$ , ...,  $\boldsymbol{\xi}^{(n)}$  are the eigenvectors of A, we let

$$T = \begin{bmatrix} \boldsymbol{\xi}^{(1)} & \boldsymbol{\xi}^{(2)} & \dots & \boldsymbol{\xi}^{(n)} \end{bmatrix}.$$

Then

$$\det(T) \neq 0 \implies \begin{array}{c} T^{-1} \\ \text{exists} \end{array} \implies \begin{array}{c} T^{-1}AT \\ \text{is diagonal} \end{array}$$

Now consider

$$\mathbf{x}' = A\mathbf{x}$$

for  $A \in \mathbb{R}^{n \times n}$ . Recall how we diagonalise a matrix: If  $\boldsymbol{\xi}^{(1)}$ ,  $\boldsymbol{\xi}^{(2)}$ , ...,  $\boldsymbol{\xi}^{(n)}$  are the eigenvectors of A, we let

$$T = \begin{bmatrix} \boldsymbol{\xi}^{(1)} & \boldsymbol{\xi}^{(2)} & \dots & \boldsymbol{\xi}^{(n)} \end{bmatrix}.$$

Then

$$\det(T) \neq 0 \implies \begin{array}{c} T^{-1} \\ \text{exists} \end{array} \implies \begin{array}{c} T^{-1}AT \\ \text{is diagonal} \end{array} \implies \begin{array}{c} A \text{ is} \\ \text{diagonalisable.} \end{array}$$

# Example

Diagonalise

$$A = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix}.$$

#### Example

Diagonalise

$$A = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix}.$$

The eigenvalues are  $r_1 = 3$  and  $r_2 = -1$ . The corresponding eigenvectors are  $\boldsymbol{\xi}^{(1)} = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$  and  $\boldsymbol{\xi}^{(2)} = \begin{bmatrix} 1 \\ -2 \end{bmatrix}$ .

#### Example

Diagonalise

$$A = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix}.$$

The eigenvalues are  $r_1 = 3$  and  $r_2 = -1$ . The corresponding eigenvectors are  $\boldsymbol{\xi}^{(1)} = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$  and  $\boldsymbol{\xi}^{(2)} = \begin{bmatrix} 1 \\ -2 \end{bmatrix}$ . Thus

$$T = \begin{bmatrix} 1 & 1 \\ 2 & -2 \end{bmatrix}$$

#### Example

Diagonalise

$$A = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix}.$$

The eigenvalues are  $r_1 = 3$  and  $r_2 = -1$ . The corresponding eigenvectors are  $\boldsymbol{\xi}^{(1)} = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$  and  $\boldsymbol{\xi}^{(2)} = \begin{bmatrix} 1 \\ -2 \end{bmatrix}$ . Thus

$$T = \begin{bmatrix} 1 & 1 \\ 2 & -2 \end{bmatrix} \quad \text{and} \quad T^{-1} = \begin{bmatrix} \frac{1}{2} & \frac{1}{4} \\ \frac{1}{2} & -\frac{1}{4} \end{bmatrix}.$$

#### Example

Diagonalise

$$A = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix}.$$

The eigenvalues are  $r_1 = 3$  and  $r_2 = -1$ . The corresponding eigenvectors are  $\boldsymbol{\xi}^{(1)} = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$  and  $\boldsymbol{\xi}^{(2)} = \begin{bmatrix} 1 \\ -2 \end{bmatrix}$ . Thus

$$T = \begin{bmatrix} 1 & 1 \\ 2 & -2 \end{bmatrix}$$
 and  $T^{-1} = \begin{bmatrix} \frac{1}{2} & \frac{1}{4} \\ \frac{1}{2} & -\frac{1}{4} \end{bmatrix}$ .

It follows that

$$D = T^{-1}AT = \begin{bmatrix} 3 & 0 \\ 0 & -1 \end{bmatrix}.$$

Now consider

$$\mathbf{x}' = A\mathbf{x}.$$

Now consider

$$\mathbf{x}' = A\mathbf{x}$$
.

Define a new variable  $\mathbf{y}$  by

$$\mathbf{x} = T\mathbf{y}$$
 or  $\mathbf{y} = T^{-1}\mathbf{x}$ .

Now consider

$$\mathbf{x}' = A\mathbf{x}$$
.

Define a new variable  $\mathbf{y}$  by

$$\mathbf{x} = T\mathbf{y}$$
 or  $\mathbf{y} = T^{-1}\mathbf{x}$ .

Then we calculate that

$$\mathbf{x}' = A\mathbf{x}$$

Now consider

$$\mathbf{x}' = A\mathbf{x}$$
.

Define a new variable  $\mathbf{y}$  by

$$\mathbf{x} = T\mathbf{y}$$
 or  $\mathbf{y} = T^{-1}\mathbf{x}$ .

Then we calculate that

$$\mathbf{x}' = A\mathbf{x}$$
$$T\mathbf{y}' = AT\mathbf{y}$$

Now consider

$$\mathbf{x}' = A\mathbf{x}$$
.

Define a new variable  $\mathbf{y}$  by

$$\mathbf{x} = T\mathbf{y}$$
 or  $\mathbf{y} = T^{-1}\mathbf{x}$ .

Then we calculate that

$$\mathbf{x}' = A\mathbf{x}$$
  
 $T\mathbf{y}' = AT\mathbf{y}$   
 $\mathbf{y}' = T^{-1}AT\mathbf{y} = D\mathbf{y}$ .

We know that a fundamental matrix for  $\mathbf{y}' = D\mathbf{y}$  is

$$\exp(Dt) = \begin{bmatrix} e^{r_1t} & 0 & \dots & 0 \\ 0 & e^{r_2t} & \dots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \dots & e^{r_nt} \end{bmatrix}.$$

We know that a fundamental matrix for  $\mathbf{y}' = D\mathbf{y}$  is

$$\exp(Dt) = \begin{bmatrix} e^{r_1t} & 0 & \dots & 0 \\ 0 & e^{r_2t} & \dots & 0 \\ \vdots & \vdots & & \vdots \\ 0 & 0 & \dots & e^{r_nt} \end{bmatrix}.$$

Therefore a fundamental matrix for  $\mathbf{x}' = A\mathbf{x}$  is

$$\Psi = T \exp(Dt) = \begin{vmatrix} \boldsymbol{\xi}^{(1)} e^{r_1 t} & \boldsymbol{\xi}^{(2)} e^{r_2 t} & \dots & \boldsymbol{\xi}^{(n)} e^{r_n t} \end{vmatrix}.$$

#### Example

Find a fundamental matrix for

$$\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}.$$

#### Example

Find a fundamental matrix for

$$\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}.$$

Recall that 
$$T = \begin{bmatrix} 1 & 1 \\ 2 & -2 \end{bmatrix}$$
.

#### Example

Find a fundamental matrix for

$$\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}.$$

Recall that 
$$T = \begin{bmatrix} 1 & 1 \\ 2 & -2 \end{bmatrix}$$
. Letting  $\mathbf{y} = T^{-1}\mathbf{x}$ , we have

$$\mathbf{y}' = \begin{bmatrix} 3 & 0 \\ 0 & -1 \end{bmatrix} \mathbf{y}.$$

A fundamental matrix for 
$$\mathbf{y}' = \begin{bmatrix} 3 & 0 \\ 0 & -1 \end{bmatrix} \mathbf{y}$$
 is

$$\exp(Dt) = e^{Dt} = \begin{bmatrix} e^{3t} & 0\\ 0 & e^{-t} \end{bmatrix}.$$

A fundamental matrix for 
$$\mathbf{y}' = \begin{bmatrix} 3 & 0 \\ 0 & -1 \end{bmatrix} \mathbf{y}$$
 is

$$\exp(Dt) = e^{Dt} = \begin{bmatrix} e^{3t} & 0\\ 0 & e^{-t} \end{bmatrix}.$$

Hence a fundamental matrix for  $\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}$  is

$$\Psi(t) = T \exp(Dt)$$

A fundamental matrix for 
$$\mathbf{y}' = \begin{bmatrix} 3 & 0 \\ 0 & -1 \end{bmatrix} \mathbf{y}$$
 is

$$\exp(Dt) = e^{Dt} = \begin{bmatrix} e^{3t} & 0\\ 0 & e^{-t} \end{bmatrix}.$$

Hence a fundamental matrix for  $\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}$  is

$$\Psi(t) = T \exp(Dt) = \begin{bmatrix} 1 & 1 \\ 2 & -2 \end{bmatrix} \begin{bmatrix} e^{3t} & 0 \\ 0 & e^{-t} \end{bmatrix}$$

A fundamental matrix for 
$$\mathbf{y}' = \begin{bmatrix} 3 & 0 \\ 0 & -1 \end{bmatrix} \mathbf{y}$$
 is

$$\exp(Dt) = e^{Dt} = \begin{bmatrix} e^{3t} & 0\\ 0 & e^{-t} \end{bmatrix}.$$

Hence a fundamental matrix for  $\mathbf{x}' = \begin{bmatrix} 1 & 1 \\ 4 & 1 \end{bmatrix} \mathbf{x}$  is

$$\Psi(t) = T \exp(Dt) = \begin{bmatrix} 1 & 1 \\ 2 & -2 \end{bmatrix} \begin{bmatrix} e^{3t} & 0 \\ 0 & e^{-t} \end{bmatrix} = \begin{bmatrix} e^{3t} & e^{-t} \\ 2e^{3t} & -2e^{-t} \end{bmatrix}.$$

# Repeated Eigenvalues

# 5.6 Repeated Eigenvalues

## Example

Find the eigenvalues and eigenvectors of  $A = \begin{bmatrix} 1 & -1 \\ 1 & 3 \end{bmatrix}$ .

# 5.6 Repeated Eigenvalues

#### Example

Find the eigenvalues and eigenvectors of  $A = \begin{bmatrix} 1 & -1 \\ 1 & 3 \end{bmatrix}$ .

We calculate that

$$0 = \det(A - rI) = \begin{vmatrix} 1 - r & -1 \\ 1 & 3 - r \end{vmatrix} = r^2 - 4r + 4 = (r - 2)^2.$$

Therefore  $r_1 = 2 = r_2$ .

# 5.6 Repeated Eigenvalues

#### Example

Find the eigenvalues and eigenvectors of  $A = \begin{bmatrix} 1 & -1 \\ 1 & 3 \end{bmatrix}$ .

We calculate that

$$0 = \det(A - rI) = \begin{vmatrix} 1 - r & -1 \\ 1 & 3 - r \end{vmatrix} = r^2 - 4r + 4 = (r - 2)^2.$$

Therefore  $r_1 = 2 = r_2$ . Moreover

$$\mathbf{0} = (A - rI)\,\boldsymbol{\xi} = \begin{bmatrix} -1 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} \xi_1 \\ \xi_2 \end{bmatrix} \implies \xi_1 + \xi_2 = 0 \implies \boldsymbol{\xi} = \begin{bmatrix} 1 \\ -1 \end{bmatrix}.$$

### Example

Find the eigenvalues and eigenvectors of  $A = \begin{bmatrix} 1 & -1 \\ 1 & 3 \end{bmatrix}$ .

We calculate that

$$0 = \det(A - rI) = \begin{vmatrix} 1 - r & -1 \\ 1 & 3 - r \end{vmatrix} = r^2 - 4r + 4 = (r - 2)^2.$$

Therefore  $r_1 = 2 = r_2$ . Moreover

$$\mathbf{0} = (A - rI)\,\boldsymbol{\xi} = \begin{bmatrix} -1 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} \xi_1 \\ \xi_2 \end{bmatrix} \implies \xi_1 + \xi_2 = 0 \implies \boldsymbol{\xi} = \begin{bmatrix} 1 \\ -1 \end{bmatrix}.$$

Note that A has only one linearly independent eigenvector.

### Example

Solve

$$\mathbf{x}' = \begin{bmatrix} 1 & -1 \\ 1 & 3 \end{bmatrix} \mathbf{x}.$$

### Example

Solve

$$\mathbf{x}' = \begin{bmatrix} 1 & -1 \\ 1 & 3 \end{bmatrix} \mathbf{x}.$$

We know that

$$\mathbf{x}^{(1)}(t) = \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{2t}$$

is a solution. But we need two solutions.

### Guess 1: I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t}$$

for some  $\boldsymbol{\xi} \in \mathbb{R}^2$ .

#### Guess 1: I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t}$$

$$\mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)}$$

Guess 1: I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t}$$

$$\xi e^{2t} + 2\xi t e^{2t} = \mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)}$$

Guess 1: I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t}$$

$$\boldsymbol{\xi}e^{2t} + 2\boldsymbol{\xi}te^{2t} = \mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)} = A\boldsymbol{\xi}te^{2t}$$

Guess 1: I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t}$$

$$\xi e^{2t} + 2\xi t e^{2t} = \mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)} = A\xi t e^{2t}$$
  
 $\xi + (2\xi - A\xi)t = \mathbf{0} \quad \forall t$ 

Guess 1: I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t}$$

for some  $\boldsymbol{\xi} \in \mathbb{R}^2$ . Then we have

$$\boldsymbol{\xi}e^{2t} + 2\boldsymbol{\xi}te^{2t} = \mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)} = A\boldsymbol{\xi}te^{2t}$$
$$\boldsymbol{\xi} + (2\boldsymbol{\xi} - A\boldsymbol{\xi})t = \mathbf{0} \qquad \forall t$$
$$\implies \boldsymbol{\xi} = \mathbf{0}.$$

This guess did not work.

Guess 2: Now I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t}$$

for some  $\boldsymbol{\xi}, \boldsymbol{\eta} \in \mathbb{R}^2$ .

Guess 2: Now I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t}$$

for some  $\boldsymbol{\xi}, \boldsymbol{\eta} \in \mathbb{R}^2$ . Then we have

$$\mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)}$$

Guess 2: Now I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t}$$

for some  $\boldsymbol{\xi}, \boldsymbol{\eta} \in \mathbb{R}^2$ . Then we have

$$\xi e^{2t} + 2\xi t e^{2t} + 2\eta e^{2t} = \mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)}$$

Guess 2: Now I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t}$$

for some  $\boldsymbol{\xi}, \boldsymbol{\eta} \in \mathbb{R}^2$ . Then we have

$$\xi e^{2t} + 2\xi t e^{2t} + 2\eta e^{2t} = \mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)} = A\left(\xi t e^{2t} + \eta e^{2t}\right)$$

Guess 2: Now I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t}$$

for some  $\boldsymbol{\xi}, \boldsymbol{\eta} \in \mathbb{R}^2$ . Then we have

$$\boldsymbol{\xi}e^{2t} + 2\boldsymbol{\xi}te^{2t} + 2\boldsymbol{\eta}e^{2t} = \mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)} = A\left(\boldsymbol{\xi}te^{2t} + \boldsymbol{\eta}e^{2t}\right)$$

and

$$(2\boldsymbol{\xi} - A\boldsymbol{\xi}) t + (\boldsymbol{\xi} + 2\boldsymbol{\eta} - A\boldsymbol{\eta}) = \mathbf{0}.$$

Guess 2: Now I guess that

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t}$$

for some  $\boldsymbol{\xi}, \boldsymbol{\eta} \in \mathbb{R}^2$ . Then we have

$$\boldsymbol{\xi}e^{2t} + 2\boldsymbol{\xi}te^{2t} + 2\boldsymbol{\eta}e^{2t} = \mathbf{x}^{(2)\prime} = A\mathbf{x}^{(2)} = A\left(\boldsymbol{\xi}te^{2t} + \boldsymbol{\eta}e^{2t}\right)$$

and

$$(2\boldsymbol{\xi} - A\boldsymbol{\xi}) t + (\boldsymbol{\xi} + 2\boldsymbol{\eta} - A\boldsymbol{\eta}) = \mathbf{0}.$$

Since this must be true  $\forall t$ , we must have

$$(A-2I)\boldsymbol{\xi} = \mathbf{0}$$
 and  $(A-2I)\boldsymbol{\eta} = \boldsymbol{\xi}$ .

5.6

# $(A-2I)\boldsymbol{\xi} = \boldsymbol{0} \qquad (A-2I)\boldsymbol{\eta} = \boldsymbol{\xi}$

Clearly 
$$\boldsymbol{\xi} = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$$
.

Clearly 
$$\boldsymbol{\xi} = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$$
. Then we calculate that

$$\begin{bmatrix} -1 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} \implies \eta_1 + \eta_2 = -1$$

Clearly  $\boldsymbol{\xi} = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$ . Then we calculate that

$$\begin{bmatrix} -1 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} \implies \eta_1 + \eta_2 = -1$$

$$\implies \boldsymbol{\eta} = \begin{bmatrix} k \\ -1 - k \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \end{bmatrix} + k \begin{bmatrix} 1 \\ -1 \end{bmatrix}$$

for some k.

Clearly  $\boldsymbol{\xi} = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$ . Then we calculate that

$$\begin{bmatrix} -1 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} \implies \eta_1 + \eta_2 = -1$$

$$\implies \boldsymbol{\eta} = \begin{bmatrix} k \\ -1 - k \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \end{bmatrix} + k \begin{bmatrix} 1 \\ -1 \end{bmatrix}$$

for some k. So

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ -1 \end{bmatrix} e^{2t} + k \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{2t}$$

Clearly  $\boldsymbol{\xi} = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$ . Then we calculate that

$$\begin{bmatrix} -1 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} \implies \eta_1 + \eta_2 = -1$$

$$\implies \boldsymbol{\eta} = \begin{bmatrix} k \\ -1 - k \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \end{bmatrix} + k \begin{bmatrix} 1 \\ -1 \end{bmatrix}$$

for some k. So

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ -1 \end{bmatrix} e^{2t} + k \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{2t}$$
$$= \begin{bmatrix} 1 \\ -1 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ -1 \end{bmatrix} e^{2t} + k \mathbf{x}^{(1)}(t).$$

$$\mathbf{x}^{(2)}(t) = \begin{bmatrix} 1 \\ -1 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ -1 \end{bmatrix} e^{2t} + k\mathbf{x}^{(1)}(t)$$

Because we already have  $\mathbf{x}^{(1)}(t)$ , we can choose k=0. So

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{2t} + \boldsymbol{\eta} e^{2t} = \begin{bmatrix} 1 \\ -1 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ -1 \end{bmatrix} e^{2t}.$$

The general solution of  $\mathbf{x}' = \begin{bmatrix} 1 & -1 \\ 1 & 3 \end{bmatrix} \mathbf{x}$  is therefore

$$\mathbf{x}(t) = c_1 \mathbf{x}^{(1)} + c_2 \mathbf{x}^{(2)} = c_1 \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{2t} + c_2 \left( \begin{bmatrix} 1 \\ -1 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ -1 \end{bmatrix} e^{2t} \right).$$

### Example

Find a fundamental matrix for

$$\mathbf{x}' = \begin{bmatrix} 1 & -1 \\ 1 & 3 \end{bmatrix} \mathbf{x}.$$

Then find the special fundamental matrix  $\Phi(t)$  which satisfies  $\Phi(0) = I$ .

Since 
$$\mathbf{x}^{(1)}(t) = \begin{bmatrix} 1 \\ -1 \end{bmatrix} e^{2t}$$
 and  $\mathbf{x}^{(2)}(t) = \begin{bmatrix} 1 \\ -1 \end{bmatrix} t e^{2t} + \begin{bmatrix} 0 \\ -1 \end{bmatrix} e^{2t}$  we have that

$$\Psi(t) = \begin{bmatrix} \mathbf{x}^{(1)} & \mathbf{x}^{(2)} \end{bmatrix} = \begin{bmatrix} e^{2t} & te^{2t} \\ -e^{2t} & -te^{2t} - e^{2t} \end{bmatrix}$$

is a fundamental matrix for this system.

# $\Psi(t) = \begin{bmatrix} e^{2t} & te^{2t} \\ -e^{2t} & -te^{2t} - e^{2t} \end{bmatrix}$

Now

$$\Psi(0) = \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix}$$
 and  $\Psi^{-1}(0) = \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix}$ .

Now

$$\Psi(0) = \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix}$$
 and  $\Psi^{-1}(0) = \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix}$ .

Therefore

$$\exp(At) = \Phi(t) = \Psi(t)\Psi^{-1}(0)$$

$$\Psi(t) = \begin{bmatrix} e^{2t} & te^{2t} \\ -e^{2t} & -te^{2t} - e^{2t} \end{bmatrix}$$

Now

$$\Psi(0) = \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix} \quad \text{and} \quad \Psi^{-1}(0) = \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix}.$$

Therefore

$$\exp(At) = \Phi(t) = \Psi(t)\Psi^{-1}(0) = e^{2t} \begin{bmatrix} 1 & t \\ -1 & -1 - t \end{bmatrix} \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix}$$

$$\Psi(t) = \begin{bmatrix} e^{2t} & te^{2t} \\ -e^{2t} & -te^{2t} - e^{2t} \end{bmatrix}$$

Now

$$\Psi(0) = \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix} \quad \text{and} \quad \Psi^{-1}(0) = \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix}.$$

Therefore

$$\exp(At) = \Phi(t) = \Psi(t)\Psi^{-1}(0) = e^{2t} \begin{bmatrix} 1 & t \\ -1 & -1 - t \end{bmatrix} \begin{bmatrix} 1 & 0 \\ -1 & -1 \end{bmatrix}$$
$$= e^{2t} \begin{bmatrix} 1 - t & -t \\ t & 1 + t \end{bmatrix}.$$

#### Remark

$$\mathbf{x}' = A\mathbf{x}$$

For two repeated eigenvalues (but with only one linearly independent eigenvector), the key equations to remember are

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{rt} + \boldsymbol{\eta} e^{rt}$$
 and  $(A - rI)\boldsymbol{\eta} = \boldsymbol{\xi}$ .

$$(A - rI)\boldsymbol{\eta} = \boldsymbol{\xi}$$

#### Remark

$$\mathbf{x}' = A\mathbf{x}$$

For two repeated eigenvalues (but with only one linearly independent eigenvector), the key equations to remember are

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{rt} + \boldsymbol{\eta} e^{rt}$$
 and  $(A - rI)\boldsymbol{\eta} = \boldsymbol{\xi}$ .

#### **D**efinition

 $\eta$  is called a generalised eigenvector of A.

#### Remark

If you have 2 repeated eigenvalues (but with only one linearly independent eigenvector), the method is:

- 1 Find the eigenvalues and eigenvectors;
- **2** The first solution is  $\mathbf{x}^{(1)}(t) = \boldsymbol{\xi} e^{rt}$ ;
- Use  $(A rI)\eta = \xi$  to find a generalised eigenvector  $\eta$ ;
- **4** The second solution is  $\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{rt} + \boldsymbol{\eta} e^{rt}$ .

### Example

Solve

$$\begin{cases} \mathbf{x}' = \begin{bmatrix} -\frac{5}{2} & \frac{3}{2} \\ -\frac{3}{2} & \frac{1}{2} \end{bmatrix} \mathbf{x}, \\ \mathbf{x}(0) = \begin{bmatrix} 3 \\ -1 \end{bmatrix}. \end{cases}$$

The only eigenvalue of the matrix is r=-1. The corresponding eigenvector is  $\boldsymbol{\xi}=\begin{bmatrix}1\\1\end{bmatrix}$ . Therefore one solution of the linear system is

$$\mathbf{x}^{(1)}(t) = \boldsymbol{\xi} e^{rt} = \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-t}.$$

We need to find a second, linearly independent solution. We will consider the ansatz

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{-t} + \boldsymbol{\eta} e^{-t}$$

where  $\boldsymbol{\xi} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$  as above and  $\boldsymbol{\eta}$  is a generalised eigenvector solving  $(A - rI)\boldsymbol{\eta} = \boldsymbol{\xi}$ .

Solving the latter equation,

$$(A-rI)\pmb{\eta}=\pmb{\xi}$$

Solving the latter equation,

$$(A - rI)\boldsymbol{\eta} = \boldsymbol{\xi}$$
 
$$\begin{bmatrix} -\frac{3}{2} & \frac{3}{2} \\ -\frac{3}{2} & \frac{3}{2} \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Solving the latter equation,

$$(A - rI)\boldsymbol{\eta} = \boldsymbol{\xi}$$

$$\begin{bmatrix} -\frac{3}{2} & \frac{3}{2} \\ -\frac{3}{2} & \frac{3}{2} \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$-\frac{3}{2}\eta_1 + \frac{3}{2}\eta_2 = 1$$

Solving the latter equation,

$$(A - rI)\boldsymbol{\eta} = \boldsymbol{\xi}$$

$$\begin{bmatrix} -\frac{3}{2} & \frac{3}{2} \\ -\frac{3}{2} & \frac{3}{2} \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$-\frac{3}{2}\eta_1 + \frac{3}{2}\eta_2 = 1$$

$$-\eta_1 + \eta_2 = \frac{2}{3}$$

Solving the latter equation,

$$(A - rI)\boldsymbol{\eta} = \boldsymbol{\xi}$$

$$\begin{bmatrix} -\frac{3}{2} & \frac{3}{2} \\ -\frac{3}{2} & \frac{3}{2} \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$-\frac{3}{2}\eta_1 + \frac{3}{2}\eta_2 = 1$$

$$-\eta_1 + \eta_2 = \frac{2}{3}$$

we can choose 
$$\boldsymbol{\eta} = \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$$
.

Note that we don't need to find every generalised eigenvector

$$\boldsymbol{\eta} = \begin{bmatrix} k \\ k + \frac{2}{3} \end{bmatrix} = k \begin{bmatrix} 1 \\ 1 \end{bmatrix} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix} = k\boldsymbol{\xi} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$$

because we already have  $\mathbf{x}^{(1)}(t) = \boldsymbol{\xi}e^{rt}$ .

Note that we don't need to find every generalised eigenvector

$$\eta = \begin{bmatrix} k \\ k + \frac{2}{3} \end{bmatrix} = k \begin{bmatrix} 1 \\ 1 \end{bmatrix} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix} = k \xi + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$$

because we already have  $\mathbf{x}^{(1)}(t) = \boldsymbol{\xi}e^{rt}$ .

Instead we only need to find one generalised eigenvector – that means that we can choose any k that we want.

Note that we don't need to find every generalised eigenvector

$$\boldsymbol{\eta} = \begin{bmatrix} k \\ k + \frac{2}{3} \end{bmatrix} = k \begin{bmatrix} 1 \\ 1 \end{bmatrix} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix} = k\boldsymbol{\xi} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$$

because we already have  $\mathbf{x}^{(1)}(t) = \boldsymbol{\xi}e^{rt}$ .

Instead we only need to find *one* generalised eigenvector – that means that we can choose any k that we want.

Hence I have chosen k = 0 which gives  $\eta = \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$ .

eigenvector

generalised eigenvector

$$\boldsymbol{\xi} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$\eta = \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$$

Thus

$$\mathbf{x}^{(1)}(t) = \boldsymbol{\xi} e^{-t} = \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-t}$$

and

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{-t} + \boldsymbol{\eta} e^{-t} = \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-t} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix} e^{-t}.$$

eigenvector

generalised eigenvector

$$\boldsymbol{\xi} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$\boldsymbol{\eta} = \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$$

Thus

$$\mathbf{x}^{(1)}(t) = \boldsymbol{\xi} e^{-t} = \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-t}$$

and

$$\mathbf{x}^{(2)}(t) = \boldsymbol{\xi} t e^{-t} + \boldsymbol{\eta} e^{-t} = \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-t} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix} e^{-t}.$$

Hence the general solution to the linear system is

$$\mathbf{x}(t) = c_1 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-t} + c_2 \left( \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-t} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix} e^{-t} \right).$$

The initial condition gives

$$\begin{bmatrix} 3 \\ -1 \end{bmatrix} = \mathbf{x}(0) = c_1 \begin{bmatrix} 1 \\ 1 \end{bmatrix} + c_2 \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$$

which implies that  $c_1 = 3$  and  $c_2 = -6$ .

The initial condition gives

$$\begin{bmatrix} 3 \\ -1 \end{bmatrix} = \mathbf{x}(0) = c_1 \begin{bmatrix} 1 \\ 1 \end{bmatrix} + c_2 \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix}$$

which implies that  $c_1 = 3$  and  $c_2 = -6$ .

$$\mathbf{x}(t) = 3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-t} - 6 \left( \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-t} + \begin{bmatrix} 0 \\ \frac{2}{3} \end{bmatrix} e^{-t} \right) = \begin{bmatrix} 3 \\ -1 \end{bmatrix} e^{-t} - 6 \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-t}.$$

#### Example

Solve

$$\mathbf{x}' = \begin{bmatrix} 1 & -4 \\ 4 & -7 \end{bmatrix} \mathbf{x}, \qquad \mathbf{x}(0) = \begin{bmatrix} 3 \\ 2 \end{bmatrix}.$$

#### Example

Solve

$$\mathbf{x}' = \begin{bmatrix} 1 & -4 \\ 4 & -7 \end{bmatrix} \mathbf{x}, \qquad \mathbf{x}(0) = \begin{bmatrix} 3 \\ 2 \end{bmatrix}.$$

The only eigenvalue of the matrix is r=-3. The corresponding eigenvector is  $\boldsymbol{\xi}=\begin{bmatrix}1\\1\end{bmatrix}$ .

#### Example

Solve

$$\mathbf{x}' = \begin{bmatrix} 1 & -4 \\ 4 & -7 \end{bmatrix} \mathbf{x}, \qquad \mathbf{x}(0) = \begin{bmatrix} 3 \\ 2 \end{bmatrix}.$$

The only eigenvalue of the matrix is r=-3. The corresponding eigenvector is  $\boldsymbol{\xi}=\begin{bmatrix}1\\1\end{bmatrix}$ . Therefore one solution of the linear system is

$$\mathbf{x}^{(1)}(t) = \boldsymbol{\xi}e^{rt} = \begin{bmatrix} 1\\1 \end{bmatrix} e^{-3t}.$$

Next we need to find a generalised eigenvector  $\eta$ .

$$(A-rI)\eta=\xi$$

$$\begin{bmatrix} 4 & -4 \\ 4 & -4 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$4\eta_1 - 4\eta_2 = 1$$

$$-\eta_1 + \eta_2 = -\frac{1}{4}$$

$$\eta_2 = \eta_1 - \frac{1}{4}.$$

We calculate that

$$\eta_2 = \eta_1 - \frac{1}{4}.$$

We can choose any vector  $\boldsymbol{\eta}$  that satisfies  $\eta_2 = \eta_1 - \frac{1}{4}$ .

We calculate that

$$\eta_2 = \eta_1 - \frac{1}{4}.$$

We can choose any vector  $\boldsymbol{\eta}$  that satisfies  $\eta_2 = \eta_1 - \frac{1}{4}$ . Thus we may choose  $\boldsymbol{\eta} = \begin{bmatrix} 0 \\ -\frac{1}{4} \end{bmatrix}$ .

eigenvector

generalised eigenvector

$$\boldsymbol{\xi} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$\eta = \begin{bmatrix} 0 \\ -\frac{1}{4} \end{bmatrix}$$

Therefore

$$\mathbf{x}^{(2)}(t) = \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-3t} + \begin{bmatrix} 0 \\ -\frac{1}{4} \end{bmatrix} e^{-3t}.$$

Hence the general solution to the ODE is

$$\mathbf{x}(t) = c_1 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-3t} + c_2 \left( \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-3t} + \begin{bmatrix} 0 \\ -\frac{1}{4} \end{bmatrix} e^{-3t} \right).$$

The initial condition gives

$$\begin{bmatrix} 3 \\ 2 \end{bmatrix} = \mathbf{x}(0) = c_1 \begin{bmatrix} 1 \\ 1 \end{bmatrix} + c_2 \begin{bmatrix} 0 \\ -\frac{1}{4} \end{bmatrix}$$

which implies that  $c_1 = 3$  and  $c_2 = 4$ .

$$\mathbf{x}(t) = 3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-3t} + 4 \left( \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-3t} + \begin{bmatrix} 0 \\ -\frac{1}{4} \end{bmatrix} e^{-3t} \right)$$

$$=$$

$$=$$

$$=$$

$$\mathbf{x}(t) = 3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-3t} + 4 \left( \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-3t} + \begin{bmatrix} 0 \\ -\frac{1}{4} \end{bmatrix} e^{-3t} \right)$$
$$= \begin{bmatrix} 3 \\ 2 \end{bmatrix} e^{-3t} + 4 \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-3t}$$
$$= .$$

$$\mathbf{x}(t) = 3 \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-3t} + 4 \left( \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-3t} + \begin{bmatrix} 0 \\ -\frac{1}{4} \end{bmatrix} e^{-3t} \right)$$
$$= \begin{bmatrix} 3 \\ 2 \end{bmatrix} e^{-3t} + 4 \begin{bmatrix} 1 \\ 1 \end{bmatrix} t e^{-3t}$$
$$= \begin{bmatrix} 3 + 4t \\ 2 + 4t \end{bmatrix} e^{-3t}.$$
